(54) **Bilayered cosmetic product, uses thereof and kit-of-parts containing this product.**

(57) The invention relates to a cosmetic product containing a first and a second composition, the first composition comprising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and the second composition

comprising a cosmetically acceptable medium.

The invention also relates to a makeup process and to a makeup kit containing the said product. This product is in particular a lipstick, a mascara or a nail varnish.

EP 1 518 534 A2

Description

[0001] The present invention relates to a cosmetic product comprising at least two compositions that may be applied successively to the skin either of the face or of the body, the lower and upper eyelids, the lips and integuments such as the nails, the eyebrows, the eyelashes or the hair. The present invention also relates to a process for making up the face and the body using these two compositions.

[0002] Each composition may be a foundation, a makeup rouge, an eyeshadow, a concealer product, a blusher, a free or compacted powder, a lipstick, a lip balm, a lip gloss, a lip pencil, an eye pencil, a mascara, an eyeliner, a nail varnish or a body-makeup or skin-colouring product.

[0003] The known compositions have poor staying power over time and in particular poor colour fastness and poor staying power of the gloss over time. This poor staying power may be characterized by a modification of the colour (colour change or fading) generally following an interaction with the sebum and/or sweat secreted by the skin in the case of foundations and makeup powders, or an interaction with the saliva in the case of lipsticks, or a reduction in the gloss, in the case of a nail varnish. This obliges the user to reapply the makeup very often, which may constitute a loss of time.

[0004] In addition, the known compositions have a tendency to migrate, i.e. to travel over time in the folds of the wrinkles and fine lines of the skin, especially those around the lips and the eyes, resulting in an unattractive effect. Women often mention this migration as a major defect of cosmetic compositions, in particular standard lipsticks and eyeshadows. The term "migration" means an overflowing of the composition and in particular of the colour, beyond the initial line of the makeup.

[0005] "Transfer-resistant" lip and skin makeup compositions are compositions that have the advantage of forming a deposit that does not come off, at least partly, onto the supports with which they are placed in contact (glass, clothing, cigarette or fabrics).

[0006] The known transfer-resistant compositions are generally based on silicone resins and volatile silicone oils, and, although having improved staying power properties, they have the drawback of leaving on the skin and the lips, after evaporation of the volatile silicone oils, a film that becomes uncomfortable over time (sensation of dryness and tautness), which puts a certain number of women off lipsticks of this type.

[0007] In addition, these compositions based on volatile silicone oils and silicone resins lead to matt coloured films. Now, women are nowadays in search of products, especially for colouring the lips or the eyelids, that are glossy while at the same time having good staying power and being transfer-resistant.

[0008] To obtain transfer-resistant products with good staying power, volatile oils or polymers dispersed in a volatile solvent are often used. However, these products are not sufficiently glossy. A cosmetic product comprising two compositions, a first containing a polymer dispersed in a volatile solvent, over which is applied a second glossy and greasy composition, has thus been envisaged (FR-A-2 823 101). The staying power of the colour of the makeup obtained with these compositions is good, but the disappearance of the second composition in the course of the day when it is worn results in a loss of gloss, which is desired by the consumer.

[0009] The company Kose has moreover proposed in its patent application JP-A-05 221 829 to use a gel based on perfluoro materials, which is applied over a film of lipstick so as to prevent it from being transferred onto other surfaces, the gel being incompatible with the film of lipstick.

[0010] Mention may also be made of patent application WO-A-97/17057, which describes a method for increasing the staying-power and transfer-resistance properties, consisting in applying two compositions one over the other. The composition to be applied has a global Hildebrand solubility parameter of less than $8.5 \text{ (cal/cm}^3)^{1/2}$, and the composition to be applied as topcoat must contain oils whose calculated coefficient of partition ClogP is at least equal to 13.

[0011] Patent US-A-6 001 374 proposes a multicoat makeup system, which consists in using a composition containing a resin that is soluble in alcohol and insoluble in water, which may be applied as a basecoat or as a topcoat, and which has the advantage of not marking an object placed in contact with the makeup and of being resistant to water and to rubbing, while at the same time having a certain level of gloss. However, this composition contains a water-soluble alcohol, in particular ethanol, which has an irritant, dehydrating nature on the skin and more especially on the lips, and which is particularly uncomfortable when the skin or the lips are damaged.

[0012] Patent application WO 02/067877 describes a method for improving the aesthetic properties of a transfer-resistant composition, which consists in applying a second composition over a film of transfer-resistant composition. The second composition should not interact chemically with the transfer-resistant composition, so as not to impair its cosmetic properties. Some of the products described in the said document have an unpleasant odour and are tacky. Other products are not glossy enough.

[0013] The aim of the present invention is to propose a novel route for formulating a cosmetic product, in particular a makeup product, of the type comprising two compositions to be applied successively one after the other.

[0014] An object of the invention is in particular to prepare such a cosmetic product that allows good transfer-resistance and gloss fastness properties, compared especially with the product of patent application WO-A-97/17057.

[0015] An object of the present invention is also to propose a cosmetic product, in particular a makeup product, that simultaneously combines the following properties: "transfer resistance", migration resistance, colourfastness, comfort, absence of dehydration, gloss and staying power of the gloss over time.

[0016] The Applicant has found that these objects can be obtained by combining a first composition comprising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and a second composition comprising a cosmetically acceptable medium.

[0017] Thus, the compositions according to at least some of the aspects of the invention make it possible to obtain a cosmetic result that is very glossy on application and over time, which does not migrate, does not transfer and shows good staying power, while at the same time being comfortable on application and over time (non-tacky and non-dehydrating, and no tautness).

[0018] In particular, the product of the invention makes it possible to obtain non-tacky continuous deposits on the skin or the lips, which give good coverage, having a very glossy appearance, which is adapted to the desire of consumers, does not migrate, does not transfer, has good staying power, is not oily and does not dry out the skin, the hair or the lips onto which it is applied, either during application or over time. It also has good stability properties and thus allows a uniform and aesthetic application.

[0019] It has moreover been found that the compositions of the product according to the invention have particularly advantageous spreading and adhesion properties on the skin, the lips or the eyelashes, and also a creamy and pleasant feel.

[0020] These staying-power, transfer-resistant and migration-resistant properties, allied with the glossy and non-greasy appearance, make a product that is particularly suitable for producing makeup products for the lips such as lipstick and lip glosses, for the eyes, such as mascara, eyeliners and eyeshadows, and for the nails or the hair.

[0021] One subject of the present invention is thus a cosmetic product for application to the skin, especially the skin of the face or the neck, the lips or the eyelids, comprising a first and a second composition, the first composition containing, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and the second composition, which is different from the first, comprising a cosmetically acceptable medium.

[0022] Preferably, the block polymer is free of styrene units.

[0023] Preferably also, the block polymer is non-elastomeric.

[0024] Another subject of the present invention is a cosmetic product for application to the integuments, especially the nails, the hair or the eyebrows, comprising a first and a second composition, the first composition containing, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and the second composition, which is separate from the first, comprising a cosmetically acceptable medium.

[0025] The product of the invention is in particular a makeup product for the skin, the nails or the hair.

[0026] The term "makeup product" means a product containing a colouring agent allowing the deposition of a colour onto a keratin material (the skin or the integuments) of a human being by applying onto the keratin material products such as lipsticks, makeup powders, eyeliners, foundations, self-tanning agents or semi-permanent makeup products (tattoos).

[0027] The product according to the invention comprises at least two cosmetically acceptable compositions packaged separately or together in the same packaging article or in at least two separate packaging articles.

[0028] Preferably, these compositions are packaged separately and, advantageously, in separate packaging articles.

[0029] One subject of the present invention is thus, in particular, a cosmetic makeup product in the form of a mascara, a makeup rouge, an eyeshadow, a lipstick, a nail varnish, a product especially having care properties, a mascara, an eyeliner, a concealer product or a makeup product for the body (such as a tattoo) or the hair.

[0030] A subject of the invention is also a makeup kit containing a cosmetic makeup product as defined above, in which the various compositions are packaged separately and are advantageously accompanied by suitable application means. These means may be fine brushes, coarse brushes, pens, pencils, felts, quills, sponges, tubes and/or foam tips.

[0031] The first composition of the product according to the invention may constitute a base coat applied onto the keratin material, and the second composition a topcoat. It is possible, however, to apply under the first coat an undercoat that may or may not have the constitution of the second coat.

[0032] It is also possible to deposit an overcoat onto the second coat, which may or may not have an identical constitution to that of the first coat. Preferably, the makeup obtained is a two-coat makeup.

[0033] The second composition may also constitute a basecoat applied onto the keratin material, and the first composition a topcoat.

[0034] In particular, the base coat is a lipstick, a mascara, a lip gloss, an eyeliner, a nail varnish, a nailcare product or a body makeup product, and the top coat a care or protective product.

[0035] The invention also relates to a process for making up the skin and/or the lips and/or the integuments, which consists in applying a cosmetic product as defined above to the skin and/or the lips and/or the integuments.

[0036] A subject of the invention is also a cosmetic care or makeup process for human skin and/or lips and/or integuments, which consists in applying to the skin, the lips and/or the integuments a first coat of a first composition com-

prising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and then in applying, over all or part of the first coat, a second coat of a second composition comprising a cosmetically acceptable medium.

[0037] This process may consist in applying to human skin, lips and/or integuments a first coat of a first composition comprising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, leaving the said first coat to dry, and then applying, over all or part of the first coat, a second coat of a second composition comprising a cosmetically acceptable medium.

[0038] This process may also consist in applying to human skin, lips and/or integuments a first coat of a composition comprising a cosmetically acceptable medium, leaving the said first coat to dry, and then applying, over all or part of the first coat, a second coat of a composition comprising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer.

[0039] The product according to the invention may be applied not only to the face but also the scalp and the body, the lips, the inside of the lower eyelids, and integuments, for instance the nails, the eyelashes, the hair, the eyebrows, or even other body hairs. The second composition may form units and may be applied with a pen, a pencil or any other instrument (sponge, finger, fine brush, coarse brush or quill). This makeup may also be applied to makeup accessories, for instance false nails, false eyelashes, wigs or pastilles or patches that adhere to the skin or the lips (such as beauty spots).

[0040] A subject of the invention is also a made-up support, comprising a first coat of a first composition comprising a cosmetically acceptable first medium, and a second coat of a second composition comprising a cosmetically acceptable second medium, the said first coat being applied to the support first or over all or part of the second coat.

[0041] This support may in particular be a hairpiece such as a wig, false nails, false eyelashes, or patches that adhere to the skin or the lips (such as beauty spots).

[0042] The invention also relates to the cosmetic use of the cosmetic product defined above to improve the comfort properties, in particular in terms of the absence of tack and/or absence of dehydration, and/or the gloss and/or the transfer and/or the migration and/or the staying power of the makeup on the skin and/or the lips and/or the integuments.

[0043] Finally, a subject of the invention is the use of a cosmetic product comprising a first and a second composition, the first composition comprising, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer as described below, and the second composition comprising a cosmetically acceptable medium, to give the skin and/or the lips and/or the integuments a comfortable and/or glossy and/or transfer-resistant and/or migration-resistant cosmetic result and/or a cosmetic result with good staying power.

Block polymer of the first composition

[0044] The block polymer of the first composition of the product according to the invention is preferably a film-forming linear ethylenic block polymer.

[0045] The first polymer contains at least one block polymer. The term "block polymer" means a polymer comprising at least two different blocks and preferably at least three different blocks.

[0046] According to one embodiment, the block polymer of the first composition is an ethylenic polymer. The term "ethylenic polymer" means a polymer obtained by polymerizing monomers comprising an ethylenic unsaturation.

[0047] According to one embodiment, the block polymer of the first composition is a linear polymer. In contrast, a polymer of non-linear structure is, for example, a polymer of branched, starburst or grafted structure, or the like.

[0048] According to one embodiment, the block polymer of the first composition is a film-forming polymer. The term "film-forming polymer" means a polymer capable of forming, by itself or in the presence of an auxiliary film-forming agent, a continuous film that adheres to a support and especially to keratin materials.

[0049] According to one embodiment, the block polymer of the first composition is a non-elastomeric polymer.

[0050] The term "non-elastomeric polymer" means a polymer which, when it is subjected to a constraint intended to stretch it (for example by 30% relative to its initial length), does not return to a length substantially identical to its initial length when the constraint ceases.

[0051] More specifically, the term "non-elastomeric polymer" denotes a polymer with an instantaneous recovery $R_i < 50\%$ and a delayed recovery $R_{2h} < 70\%$ after having been subjected to a 30% elongation. Preferably, R_i is $< 30\%$ and $R_{2h} < 50\%$.

[0052] More specifically, the non-elastomeric nature of the polymer is determined according to the following protocol:

[0053] A polymer film is prepared by pouring a solution of the polymer in a Teflon-coated mould, followed by drying for 7 days in an environment conditioned at $23 \pm 5^\circ\text{C}$ and $50 \pm 10\%$ relative humidity.

[0054] A film about $100\ \mu\text{m}$ thick is thus obtained, from which are cut rectangular specimens (for example using a punch) $15\ \text{mm}$ wide and $80\ \text{mm}$ long.

[0055] This sample is subjected to a tensile stress using a machine sold under the reference Zwick, under the same temperature and humidity conditions as for the drying.

EP 1 518 534 A2

[0056] The specimens are pulled at a speed of 50 mm/min and the distance between the jaws is 50 mm, which corresponds to the initial length (l_0) of the specimen.

[0057] The instantaneous recovery R_i is determined in the following manner:

- the specimen is pulled by 30% (ϵ_{\max}), i.e. about 0.3 times its initial length (l_0)
- the constraint is released by applying a return speed equal to the tensile speed, i.e. 50 mm/min, and the residual elongation of the specimen is measured as a percentage, after returning to zero constraint (ϵ_1).

[0058] The percentage instantaneous recovery (R_i) is given by the following formula:

$$R_i = (\epsilon_{\max} - \epsilon_1) / \epsilon_{\max} \times 100$$

[0059] To determine the delayed recovery, the percentage residual elongation of the specimen (ϵ_{2h}) is measured, 2 hours after returning to zero constraint.

[0060] The percentage delayed recovery (R_{2h}) is given by the following formula:

$$R_{2h} = (\epsilon_{\max} - \epsilon_{2h}) / \epsilon_{\max} \times 100$$

[0061] Purely as a guide, a polymer according to one embodiment of the invention has an instantaneous recovery R_i of 10% and a delayed recovery R_{2h} of 30%.

[0062] According to another embodiment, the block polymer of the first composition does not comprise any styrene units. The expression "polymer free of styrene units" means a polymer comprising less than 10%, preferably less than 5%, preferentially less than 2% and more preferentially less than 1% by weight i) of styrene units of formula $-\text{CH}(\text{C}_6\text{H}_5)-\text{CH}_2-$ or ii) of substituted styrene units, for instance methylstyrene, chlorostyrene or chloromethylstyrene.

[0063] According to one embodiment, the block polymer of the first composition is derived from aliphatic ethylenic monomers. The term "aliphatic monomer" means a monomer comprising no aromatic groups.

[0064] According to one embodiment, the block polymer is an ethylenic polymer derived from aliphatic ethylenic monomers comprising a carbon-carbon double bond and at least one ester group $-\text{COO}-$ or amide group $-\text{CON}-$. The ester group may be linked to one of the two unsaturated carbons via the carbon atom or the oxygen atom. The amide group may be linked to one of the two unsaturated carbons via the carbon atom or the nitrogen atom.

[0065] According to one embodiment, the block polymer comprises at least one first block and at least one second block.

[0066] The term "at least one block" means one or more blocks.

[0067] It is pointed out that, in the text hereinabove and hereinbelow, the terms "first" and "second" blocks do not in any way condition the order of the said blocks in the polymer structure.

[0068] According to one embodiment, the block polymer comprises at least one first block and at least one second block that have different glass transition temperatures (T_g).

[0069] In this embodiment, the first and second blocks may be linked together via an intermediate segment with a glass transition temperature between the glass transition temperatures of the first and second blocks.

[0070] According to one embodiment, the block polymer comprises at least one first block and at least one second block linked together via an intermediate segment comprising at least one constituent monomer of the first block and at least one constituent monomer of the second block.

[0071] Preferably, the intermediate block is derived essentially from constituent monomers of the first block and of the second block.

[0072] The term "essentially" means at least 85%, preferably at least 90%, better still 95% and even better still 100%.

[0073] Advantageously, the intermediate segment comprising at least one constituent monomer of the first block and at least one constituent monomer of the second block of the polymer is a random polymer.

[0074] According to one embodiment, the block polymer comprises at least one first block and at least one second block that are incompatible in the organic liquid medium of the composition of the invention.

[0075] The term "mutually incompatible blocks" means that the mixture formed from the polymer corresponding to the first block and of the polymer corresponding to the second block is not miscible in the organic liquid that is in major amount by weight contained in the organic liquid medium of the composition, at room temperature (25°C) and atmospheric pressure (10^5 Pa), for a content of the polymer mixture of greater than or equal to 5% by weight, relative to the total weight of the mixture (polymers and major organic liquid), it being understood that:

- i) the said polymers are present in the mixture in a content such that the respective weight ratio ranges from 10/90

to 90/10, and

ii) each of the polymers corresponding to the first and second blocks has an average (weight-average or number-average) molecular mass equal to that of the block polymer $\pm 15\%$.

[0076] When the organic liquid medium comprises a mixture of organic liquids, in the case of two or more liquids present in identical mass proportions, the said polymer mixture is immiscible in at least one of them.

[0077] When the organic liquid medium comprises only one organic liquid, this liquid obviously constitutes the liquid that is in major amount by weight.

[0078] The term "organic liquid medium" means a medium containing at least one organic liquid, i.e. at least one organic compound that is liquid at room temperature (25°C) and atmospheric pressure (10⁵ Pa). According to one embodiment, the major liquid of the organic liquid medium is a volatile or non-volatile oil (fatty substance). Preferably, the organic liquid is cosmetically acceptable (acceptable tolerance, toxicology and feel).

[0079] According to one embodiment, the major liquid of the organic liquid medium is the polymerization solvent or one of the polymerization solvents of the block polymer, as are described below.

[0080] The term "polymerization solvent" means a solvent or a mixture of solvents. The polymerization solvent may be chosen especially from ethyl acetate, butyl acetate, alcohols such as isopropanol and ethanol, aliphatic alkanes such as isododecane, and mixtures thereof. Preferably, the polymerization solvent is a mixture of butyl acetate and isopropanol, or isododecane.

[0081] In general, the block polymer may be incorporated into the composition to a high solids content, typically greater than 10%, greater than 20%, more preferably greater than 30% and more preferentially greater than 45% by weight relative to the total weight of the composition, while at the same time being easy to formulate.

[0082] Preferably, the block polymer comprises no silicon atoms in its skeleton. The term "skeleton" means the main chain of the polymer, as opposed to the pendent side chains.

[0083] Preferably, the polymer according to the invention is not water-soluble, i.e. the polymer is not soluble in water or in a mixture of water and linear or branched lower monoalcohols containing from 2 to 5 carbon atoms, for instance ethanol, isopropanol or n-propanol, without pH modification, at an active material content of at least 1% by weight, at room temperature (25°C).

[0084] According to one embodiment, the block polymer has a polydispersity index I of greater than 2.

[0085] Advantageously, the block polymer used in the compositions according to the invention has a polydispersity index I of greater than 2, for example ranging from 2 to 9, preferably greater than or equal to 2.5, for example ranging from 2.5 to 8 and better still greater than or equal to 2.8, and especially ranging from 2.8 to 6.

[0086] The polydispersity index I of the polymer is equal to the ratio of the weight-average mass Mw to the number-average mass Mn.

[0087] The weight-average molar mass (Mw) and number-average molar mass (Mn) are determined by gel permeation liquid chromatography (THF solvent, calibration curve established with linear polystyrene standards, refractometric detector).

[0088] The weight-average mass (Mw) of the block polymer is preferably less than or equal to 300 000; it ranges, for example, from 35 000 to 200 000 and better still from 45 000 to 150 000.

[0089] The number-average mass (Mn) of the block polymer is preferably less than or equal to 70 000; it ranges, for example, from 10 000 to 60 000 and better still from 12 000 to 50 000.

[0090] Each block of the block polymer is derived from one type of monomer or from several different types of monomer.

[0091] This means that each block may consist of a homopolymer or a copolymer; this copolymer constituting the block may in turn be random or alternating.

[0092] The glass transition temperatures indicated for the first and second blocks may be theoretical Tg values determined from the theoretical Tg values of the constituent monomers of each of the blocks, which may be found in a reference manual such as the Polymer Handbook, 3rd Edition, 1989, John Wiley, according to the following relationship, known as Fox's law:

$$1/T_g = \sum_{i=1}^n (\bar{w}_i / T_{g_i}) ,$$

\bar{w}_i being the mass fraction of the monomer i in the block under consideration and Tg_i

being the glass transition temperature of the homopolymer of the monomer i.

[0093] Unless otherwise indicated, the Tg values indicated for the first and second blocks in the present patent application are theoretical Tg values.

[0094] The difference between the glass transition temperatures of the first and second blocks is generally greater than 10°C, preferably greater than 20°C and better still greater than 30°C.

[0095] In particular, the block polymer comprises at least one first block and at least one second block such that the first block may be chosen from:

- a) a block with a Tg of greater than or equal to 40°C,
- b) a block with a Tg of less than or equal to 20°C,
- c) a block with a Tg of between 20 and 40°C, and the second block can be chosen from a category a), b) or c) different from the first block.

[0096] In the present invention, the expression:

"between ... and ..." is intended to denote a range of values for which the limits mentioned are excluded, and "from ... to ..." and "ranging from ... to ..." are intended to denote a range of values for which the limits are included.

a) Block with a Tg of greater than or equal to 40°C

[0097] The block with a Tg of greater than or equal to 40°C has, for example, a Tg ranging from 40 to 150°C, preferably greater than or equal to 50°C, for example ranging from 50°C to 120°C and better still greater than or equal to 60°C, for example ranging from 60°C to 120°C.

[0098] The block with a Tg of greater than or equal to 40°C may be a homopolymer or a copolymer. The block with a Tg of greater than or equal to 40°C may be totally or partially derived from one or more monomers, which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C.

[0099] In the case where this block is a homopolymer, it is derived from monomers which are such that the homopolymers prepared from these monomers have glass transition temperatures of greater than or equal to 40°C. This first block may be a homopolymer consisting of only one type of monomer (for which the Tg of the corresponding homopolymer is greater than or equal to 40°C).

[0100] In the case where the first block is a copolymer, it may be totally or partially derived from one or more monomers, the nature and concentration of which are chosen such that the Tg of the resulting copolymer is greater than or equal to 40°C. The copolymer may comprise, for example:

- monomers which are such that the homopolymers prepared from these monomers have Tg values of greater than or equal to 40°C, for example a Tg ranging from 40 to 150°C, preferably greater than or equal to 50°C, for example ranging from 50°C to 120°C and better still greater than or equal to 60°C, for example ranging from 60°C to 120°C, and
- monomers which are such that the homopolymers prepared from these monomers have Tg values of less than 40°C, chosen from monomers with a Tg of between 20 and 40°C and/or monomers with a Tg of less than or equal to 20°C, for example a Tg ranging from -100 to 20°C, preferably less than 15°C, especially ranging from -80°C to 15°C and better still less than 10°C, for example ranging from -50°C to 0°C, as described later.

[0101] The monomers whose homopolymers have a glass transition temperature of greater than or equal to 40°C are chosen, preferably, from the following monomers, also known as the main monomers:

- methacrylates of formula $\text{CH}_2 = \text{C}(\text{R}_1) - \text{COOR}_1$
in which R_1 represents a linear or branched unsubstituted alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group or R_1 represents a C_4 to C_{12} cycloalkyl group,
- acrylates of formula $\text{CH}_2 = \text{CH} - \text{COOR}_2$
in which R_2 represents a C_4 to C_{12} cycloalkyl group such as isobornyl acrylate or a tert-butyl group,
- (meth)acrylamides of formula:

in which R_7 and R_8 , which may be identical or different, each represent a hydrogen atom or a linear or branched C_1 to C_{12} alkyl group such as an n-butyl, t-butyl, isopropyl, isohexyl, isooctyl or isononyl group; or R_7 represents H and R_8 represents a 1,1-dimethyl-3-oxobutyl group,

and R' denotes H or methyl. Examples of monomers that may be mentioned include N-butylacrylamide, N-t-butylacrylamide, N-isopropylacrylamide, N,N-dimethylacrylamide and N,N-dibutylacrylamide, and mixtures thereof.

Main monomers that are particularly preferred are methyl methacrylate, isobutyl (meth)acrylate and isobornyl (meth)acrylate, and mixtures thereof.

b) Block with a Tg of less than or equal to 20°C

[0102] The block with a Tg of less than or equal to 20°C has, for example, a Tg ranging from -100 to 20°C, preferably less than or equal to 15°C, especially ranging from -80°C to 15°C and better still less than or equal to 10°C, for example ranging from -50°C to 0°C.

[0103] The block with a Tg of less than or equal to 20°C may be a homopolymer or a copolymer.

[0104] The block with a Tg of less than or equal to 20°C may be totally or partially derived from one or more monomers, which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C.

[0105] In the case where this block is a homopolymer, it is derived from monomers which are such that the homopolymers prepared from these monomers have glass transition temperatures of less than or equal to 20°C. This second block may be a homopolymer consisting of only one type of monomer (for which the Tg of the corresponding homopolymer is less than or equal to 20°C).

[0106] In the case where the block with a Tg of less than or equal to 20°C is a copolymer, it may be totally or partially derived from one or more monomers, the nature and concentration of which are chosen such that the Tg of the resulting copolymer is less than or equal to 20°C.

[0107] It may comprise, for example

- one or more monomers whose corresponding homopolymer has a Tg of less than or equal to 20°C, for example a Tg ranging from -100°C to 20°C, preferably less than 15°C, especially ranging from -80°C to 15°C and better still less than 10°C, for example ranging from -50°C to 0°C, and
- one or more monomers whose corresponding homopolymer has a Tg of greater than 20°C, such as monomers with a Tg of greater than or equal to 40°C, for example a Tg ranging from 40 to 150°C, preferably greater than or equal to 50°C, for example ranging from 50°C to 120°C and better still greater than or equal to 60°C, for example ranging from 60°C to 120°C and/or monomers with a Tg of between 20 and 40°C, as described above.

[0108] Preferably, the block with a Tg of less than or equal to 20°C is a homopolymer.

[0109] The monomers whose homopolymer has a Tg of less than or equal to 20°C are preferably chosen from the following monomers, or main monomer:

- acrylates of formula $CH_2 = CHCOOR_3$, R_3 representing a linear or branched C_1 to C_{12} unsubstituted alkyl group, with the exception of the tert-butyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,
- methacrylates of formula $CH_2 = C(CH_3)COOR_4$, R_4 representing a linear or branched C_6 to C_{12} unsubstituted alkyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated;
- vinyl esters of formula $R_5-CO-O-CH = CH_2$

in which R_5 represents a linear or branched C_4 to C_{12} alkyl group,

- C_4 to C_{12} alkyl vinyl ethers,
- N-(C_4 to C_{12}) alkyl acrylamides, such as N-octylacrylamide,
- and mixtures thereof.

[0110] The main monomers that are particularly preferred for the block with a Tg of less than or equal to 20°C are alkyl acrylates whose alkyl chain contains from 1 to 10 carbon atoms, with the exception of the tert-butyl group, such as methyl acrylate, isobutyl acrylate and 2-ethylhexyl acrylate, and mixtures thereof.

c) Block with a Tg of between 20 and 40°C

[0111] The block with a Tg of between 20 and 40°C may be a homopolymer or a copolymer.

[0112] The block with a Tg of between 20 and 40°C may be totally or partially derived from one or more monomers, which are such that the homopolymer prepared from these monomers has a glass transition temperature of between 20 and 40°C.

[0113] The block with a Tg of between 20 and 40°C may be totally or partially derived from monomers, which are such that the corresponding homopolymer has a Tg of greater than or equal to 40°C and from monomers which are such that the corresponding homopolymer has a Tg of less than or equal to 20°C.

[0114] In the case where this block is a homopolymer, it is derived from monomers (or main monomer) which are such that the homopolymers prepared from these monomers have glass transition temperatures of between 20 and 40°C. This first block may be a homopolymer, consisting of only one type of monomer (for which the Tg of the corresponding homopolymer ranges from 20°C to 40°C).

[0115] The monomers whose homopolymer has a glass transition temperature of between 20 and 40°C are preferably chosen from n-butyl methacrylate, cyclodecyl acrylate, neopentyl acrylate and isodecylacrylamide, and mixtures thereof.

[0116] In the case where the block with a Tg of between 20 and 40°C is a copolymer, it is totally or partially derived from one or more monomers (or main monomer) whose nature and concentration are chosen such that the Tg of the resulting copolymer is between 20 and 40°C.

[0117] Advantageously, the block with a Tg of between 20 and 40°C is a copolymer totally or partially derived from:

- main monomers whose corresponding homopolymer has a Tg of greater than or equal to 40°C, for example a Tg ranging from 40°C to 150°C, preferably greater than or equal to 50°C, for example ranging from 50 to 120°C and better still greater than or equal to 60°C, for example ranging from 60°C to 120°C, as described above, and/or
- main monomers whose corresponding homopolymer has a Tg of less than or equal to 20°C, for example a Tg ranging from -100 to 20°C, preferably less than or equal to 15°C, especially ranging from -80°C to 15°C and better still less than or equal to 10°C, for example ranging from -50°C to 0°C, as described above, the said monomers being chosen such that the Tg of the copolymer forming the first block is between 20 and 40°C.

[0118] Such main monomers are chosen, for example, from methyl methacrylate, isobornyl acrylate and methacrylate, butyl acrylate and 2-ethylhexyl acrylate, and mixtures thereof.

[0119] Preferably, the proportion of the second block with a Tg of less than or equal to 20°C ranges from 10% to 85% by weight, better still from 20% to 70% and even better still from 20% to 50% by weight of the polymer.

[0120] Preferably, each of the first and second blocks comprises at least one monomer chosen from acrylic acid, acrylic acid esters, methacrylic acid and methacrylic acid esters, and mixtures thereof.

[0121] Advantageously, each of the first and second blocks is totally derived from at least one monomer chosen from acrylic acid, acrylic acid esters, methacrylic acid and methacrylic acid esters, and mixtures thereof.

[0122] However, each of the blocks may contain in small proportion at least one constituent monomer of the other block.

[0123] Thus, the first block may contain at least one constituent monomer of the second block, and vice versa.

[0124] Each of the first and/or second blocks may comprise, in addition to the monomers indicated above, one or more other monomers known as additional monomers, which are different from the main monomers mentioned above.

[0125] The nature and amount of this or these additional monomer(s) are chosen such that the block in which they are present has the desired glass transition temperature.

[0126] This additional monomer is chosen, for example, from:

a) hydrophilic monomers such as:

- ethylenically unsaturated monomers comprising at least one carboxylic or sulfonic acid function, for instance: acrylic acid, methacrylic acid, crotonic acid, maleic anhydride, itaconic acid, fumaric acid, maleic acid, acrylamidopropanesulfonic acid, vinylbenzoic acid, vinylphosphoric acid, and salts thereof,
- ethylenically unsaturated monomers comprising at least one tertiary amine function, for instance 2-vinylpyridine, 4-vinylpyridine, dimethylaminoethyl methacrylate, diethylaminoethyl methacrylate and dimethylaminopropylmethacrylamide, and salts thereof,
- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{-COOR}_6$ in which R_6 represents a linear or branched alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group, the said alkyl group being substituted with one or more substituents chosen from hydroxyl groups (for instance 2-hydroxypropyl methacrylate and 2-hydroxyethyl methacrylate) and hal-

- ogen atoms (Cl, Br, I or F), such as trifluoroethyl methacrylate,
 - methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{-COOR}_9$,
 R_9 representing a linear or branched C_6 to C_{12} alkyl group in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated, the said alkyl group being substituted with one or more substituents
 5 chosen from hydroxyl groups and halogen atoms (Cl, Br, I or F);
 - acrylates of formula $\text{CH}_2 = \text{CHCOOR}_{10}$,
 R_{10} representing a linear or branched C_1 to C_{12} alkyl group substituted with one or more substituents chosen from hydroxyl groups and halogen atoms (Cl, Br, I or F), such as 2-hydroxypropyl acrylate and 2-hydroxyethyl acrylate, or R_{10} represents a C_1 to C_{12} alkyl-O-POE (polyoxyethylene) with repetition of the oxyethylene unit
 10 5 to 30 times, for example methoxy-POE, or
 R_{10} represents a polyoxyethylenated group comprising from 5 to 30 ethylene oxide units

b) ethylenically unsaturated monomers comprising one or more silicon atoms, such as methacryloxypropyltrimethoxysilane and methacryloxypropyl-tris(trimethylsiloxy)silane,

- and mixtures thereof.

[0127] Additional monomers that are particularly preferred are acrylic acid, methacrylic acid and trifluoroethyl methacrylate, and mixtures thereof.

[0128] According to one embodiment, each of the first and second blocks of the block polymer comprises at least one monomer chosen from (meth)acrylic acid esters and optionally at least one additional monomer such as (meth)acrylic acid, and mixtures thereof.

[0129] According to another embodiment, each of the first and second blocks of the block polymer is totally derived from at least one monomer chosen from (meth)acrylic acid esters and optionally at least one additional monomer such as (meth)acrylic acid, and mixtures thereof.

[0130] According to one preferred embodiment, the block polymer is a non-silicone polymer, i.e. a polymer free of silicon atoms.

[0131] This or these additional monomer(s) generally represent(s) an amount of less than or equal to 30% by weight, for example from 1% to 30% by weight, preferably from 5% to 20% by weight and more preferably from 7% to 15% by weight, relative to the total weight of the first and/or second blocks.

[0132] The block polymer may be obtained by free-radical solution polymerization according to the following preparation process:

- a portion of the polymerization solvent is introduced into a suitable reactor and heated until the adequate temperature for the polymerization is reached (typically between 60 and 120°C),
- once this temperature is reached, the constituent monomers of the first block are introduced in the presence of some of the polymerization initiator,
- after a time T corresponding to a maximum degree of conversion of 90%, the constituent monomers of the second block and the rest of the initiator are introduced,
- the mixture is left to react for a time T' (ranging from 3 to 6 hours), after which the mixture is cooled to room temperature,
- the polymer dissolved in the polymerization solvent is obtained.

First embodiment

[0133] According to a first embodiment, the block polymer comprises a first block with a Tg of greater than or equal to 40°C, as described above in a) and a second block with a Tg of less than or equal to 20°C, as described above in b).

[0134] Preferably, the first block with a Tg of greater than or equal to 40°C is a copolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C, such as the monomers described above.

[0135] Advantageously, the second block with a Tg of less than or equal to 20°C is a homopolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C, such as the monomers described above.

[0136] Preferably, the proportion of the block with a Tg of greater than or equal to 40°C ranges from 20% to 90%, better still from 30% to 80% and even better still from 50% to 70% by weight of the polymer. Preferably, the proportion of the block with a Tg of less than or equal to 20°C ranges from 5% to 75%, preferably from 15% to 50% and better still from 25% to 45% by weight of the polymer.

[0137] Thus, according to a first variant, the polymer according to the invention may comprise:

EP 1 518 534 A2

- a first block with a Tg of greater than or equal to 40°C, for example having a Tg ranging from 70 to 110°C, which is a methyl methacrylate/acrylic acid copolymer,
- a second block with a Tg of less than or equal to 20°C, for example ranging from 0 to 20°C, which is a methyl acrylate homopolymer, and
- 5 - an intermediate block which is a methyl methacrylate/acrylic acid/methyl acrylate copolymer.

[0138] According to a second variant, the polymer according to the invention may comprise:

- 10 - a first block with a Tg of greater than or equal to 40°C, for example ranging from 70 to 100°C, which is a methyl methacrylate/acrylic acid/trifluoroethyl methacrylate copolymer,
- a second block with a Tg of less than or equal to 20°C, for example ranging from 0 to 20°C, which is a methyl acrylate homopolymer, and
- an intermediate block which is a methyl methacrylate/acrylic acid/methyl acrylate/trifluoroethyl methacrylate random copolymer.

15 [0139] According to a third variant, the polymer according to the invention may comprise:

- a first block with a Tg of greater than or equal to 40°C, for example ranging from 85 to 115°C, which is an isobornyl acrylate/isobutyl methacrylate copolymer,
- 20 - a second block with a Tg of less than or equal to 20°C, for example ranging from -85 to -55°C, which is a 2-ethylhexyl acrylate homopolymer, and
- an intermediate block, which is an isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate random copolymer.

25 [0140] According to a fourth variant, the polymer according to the invention may comprise:

- a first block with a Tg of greater than or equal to 40°C, for example ranging from 85 to 115°C, which is an isobornyl acrylate/methyl methacrylate copolymer,
- 30 - a second block with a Tg of less than or equal to 20°C, for example ranging from -85 to -55°C, which is a 2-ethylhexyl acrylate homopolymer, and
- an intermediate block which is an isobornyl acrylate/methyl methacrylate/2-ethylhexyl acrylate random copolymer.

[0141] According to a fifth variant, the polymer according to the invention may comprise:

- 35 - a first block with a Tg of greater than or equal to 40°C, for example ranging from 95 to 125°C, which is an isobornyl acrylate/isobornyl methacrylate copolymer,
- a second block with a Tg of less than or equal to 20°C, for example ranging from -85 to -55°C, which is a 2-ethylhexyl acrylate homopolymer, and
- 40 - an intermediate block which is an isobornyl acrylate/isobornyl methacrylate/2-ethylhexyl acrylate random copolymer.

[0142] According to a sixth variant, the polymer according to the invention may comprise:

- 45 - a first block with a Tg of greater than or equal to 40°C, for example ranging from 85 to 115°C, which is an isobornyl methacrylate/isobutyl methacrylate copolymer,
- a second block with a Tg of less than or equal to 20°C, for example ranging from -35 to -5°C, which is an isobutyl acrylate homopolymer, and
- an intermediate block which is an isobornyl methacrylate/isobutyl methacrylate/isobutyl acrylate random copolymer.

50 [0143] According to a seventh variant, the polymer according to the invention may comprise:

- a first block with a Tg of greater than or equal to 40°C, for example ranging from 95 to 125°C, which is an isobornyl acrylate/isobornyl methacrylate copolymer,
- 55 - a second block with a Tg of less than or equal to 20°C, for example ranging from -35 to -5°C, which is an isobutyl acrylate homopolymer, and
- an intermediate block which is an isobornyl acrylate/isobornyl methacrylate/isobutyl acrylate random copolymer.

[0144] According to an eighth variant, the polymer according to the invention may comprise:

- a first block with a Tg of greater than or equal to 40°C, for example ranging from 60 to 90°C, which is an isobornyl acrylate/isobornyl methacrylate copolymer,
- a second block with a Tg of less than or equal to 20°C, for example ranging from -35 to -5°C, which is an isobutyl acrylate homopolymer, and
- an intermediate block which is an isobornyl acrylate/isobutyl methacrylate/isobutyl acrylate random copolymer.

[0145] The examples that follow illustrate, in a non-limiting manner, polymers corresponding to this first embodiment.

[0146] The amounts are expressed in grams.

Example 1: Preparation of a poly(methyl methacrylate)/acrylic acid/methyl acrylate) polymer

[0147] 100 g of butyl acetate are introduced into a 1 litre reactor and the temperature is then raised so as to pass from room temperature (25°C) to 90°C in 1 hour. 180 g of methyl methacrylate, 30 g of acrylic acid, 40 g of butyl acetate, 70 g of isopropanol and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added.

[0148] The mixture is maintained at 90°C for 1 hour.

[0149] 90 g of methyl acrylate, 70 g of butyl acetate, 20 g of isopropanol and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 1 hour.

[0150] The mixture is maintained at 90°C for 3 hours and then diluted with 105 g of butyl acetate and 45 g of isopropanol, and the mixture is then cooled.

[0151] A solution containing 40% polymer active material in a butyl acetate/isopropanol mixture is obtained.

[0152] A polymer comprising a poly(methyl methacrylate/acrylic acid) first block with a Tg of 100°C, a polymethyl acrylate second block with a Tg of 10°C and an intermediate block which is a methyl methacrylate/acrylic acid/polymethyl acrylate random polymer is obtained.

[0153] This polymer has a weight-average mass of 52 000 and a number-average mass of 18 000, i.e. a polydispersity index I of 2.89.

Example 2: Preparation of a poly(isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate) polymer

[0154] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 120 g of isobornyl acrylate, 90 g of isobutyl methacrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour.

[0155] The mixture is maintained at 90°C for 1 hour 30 minutes.

[0156] 90 g of 2-ethylhexyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 30 minutes.

[0157] The mixture is maintained at 90°C for 3 hours and is then cooled.

[0158] A solution containing 50% polymer active material in isododecane is obtained.

[0159] A polymer comprising a poly(isobornyl acrylate/isobutyl methacrylate) first block with a Tg of 80°C, a poly-2-ethylhexyl acrylate second block with a Tg of -70°C and an intermediate block which is an isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate random polymer is obtained.

[0160] This polymer has a weight-average mass of 77 000 and a number-average mass of 19 000, i.e. a polydispersity index I of 4.05.

Example 3: Preparation of a poly(isobornyl acrylate/isobornyl methacrylate/2-ethylhexyl acrylate) polymer

[0161] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 105 g of isobornyl acrylate, 105 g of isobornyl methacrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour.

[0162] The mixture is maintained at 90°C for 1 hour 30 minutes.

[0163] 90 g of 2-ethylhexyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 30 minutes.

[0164] The mixture is maintained at 90°C for 3 hours and is then cooled.

[0165] A solution containing 50% polymer active material in isododecane is obtained.

[0166] A polymer comprising a poly(isobornyl acrylate/isobornyl methacrylate) first block with a Tg of 110°C, a poly-

2-ethylhexyl acrylate second block with a Tg of -70°C and an intermediate block which is an isobornyl acrylate/isobornyl methacrylate/2-ethylhexyl acrylate random polymer is obtained.

[0167] This polymer has a weight-average mass of 103 900 and a number-average mass of 21 300, i.e. a polydispersity index I of 4.89.

Example 4: Preparation of a poly(isobornyl methacrylate/isobutyl methacrylate/isobutyl acrylate) polymer

[0168] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 120 g of isobornyl methacrylate, 90 g of isobutyl methacrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour.

[0169] The mixture is maintained at 90°C for 1 hour 30 minutes.

[0170] 90 g of isobutyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 30 minutes.

[0171] The mixture is maintained at 90°C for 3 hours and is then cooled.

[0172] A solution containing 50% polymer active material in isododecane is obtained.

[0173] A polymer comprising a poly(isobornyl methacrylate/isobutyl methacrylate) first block with a Tg of 95°C, a polyisobutyl acrylate second block with a Tg of -20°C and an intermediate block which is an isobornyl methacrylate/isobutyl methacrylate/isobutyl acrylate random polymer is obtained.

[0174] This polymer has a weight-average mass of 100 700 and a number-average mass of 20 800, i.e. a polydispersity index I of 4.85.

Example 5: Preparation of a poly(isobornyl acrylate/isobornyl methacrylate/isobutyl acrylate) polymer

[0175] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 105 g of isobornyl acrylate, 105 g of isobornyl methacrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour.

[0176] The mixture is maintained at 90°C for 1 hour 30 minutes.

[0177] 90 g of isobutyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 30 minutes.

[0178] The mixture is maintained at 90°C for 3 hours and is then cooled.

[0179] A solution containing 50% polymer active material in isododecane is obtained.

[0180] A polymer comprising a poly(isobornyl acrylate/isobornyl methacrylate) first block with a Tg of 110°C, a polyisobutyl acrylate second block with a Tg of -20°C and an intermediate block which is an isobornyl acrylate/isobornyl methacrylate/isobutyl acrylate random polymer is obtained.

[0181] This polymer has a weight-average mass of 151 000 and a number-average mass of 41 200, i.e. a polydispersity index I of 3.66.

Example 6: Preparation of a poly(isobornyl acrylate/isobutyl methacrylate/isobutyl acrylate) polymer

[0182] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 120 g of isobornyl acrylate, 90 g of isobutyl methacrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour.

[0183] The mixture is maintained at 90°C for 1 hour 30 minutes.

[0184] 90 g of isobutyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 30 minutes.

[0185] The mixture is maintained at 90°C for 3 hours and is then cooled.

[0186] A solution containing 50% polymer active material in isododecane is obtained.

[0187] A polymer comprising a poly(isobornyl acrylate/isobutyl methacrylate) first block with a Tg of 75°C, a polyisobutyl acrylate second block with a Tg of -20°C and an intermediate block which is an isobornyl acrylate/isobutyl methacrylate/isobutyl acrylate random polymer is obtained.

[0188] This polymer has a weight average mass of 144 200 and a number-average mass of 49 300, i.e. a polydispersity index I of 2.93.

Second embodiment

[0189] According to a second embodiment, the block polymer comprises a first block having a glass transition temperature (T_g) of between 20 and 40°C, in accordance with the blocks described in c) and a second block having a glass transition temperature of less than or equal to 20°C, as described above in b) or a glass transition temperature of greater than or equal to 40°C, as described in a) above.

[0190] Preferably, the proportion of the first block with a T_g of between 20 and 40°C ranges from 10% to 85%, better still from 30% to 80% and even better still from 50% to 70% by weight of the polymer.

[0191] When the second block is a block with a T_g of greater than or equal to 40°C, it is preferably present in a proportion ranging from 10% to 85% by weight, better still from 20% to 70% and even better still from 30% to 70% by weight of the polymer.

[0192] When the second block is a block with a T_g of less than or equal to 20°C, it is preferably present in a proportion ranging from 10% to 85% by weight, better still from 20% to 70% and even better still from 20% to 50% by weight of the polymer.

[0193] Preferably, the first block with a T_g of between 20 and 40°C is a copolymer derived from monomers which are such that the corresponding homopolymer has a T_g of greater than or equal to 40°C, and from monomers which are such that the corresponding homopolymer has a T_g of less than or equal to 20°C.

[0194] Advantageously, the second block with a T_g of less than or equal to 20°C or with a T_g of greater than or equal to 40°C is a homopolymer.

[0195] Thus, according to a first variant of this second embodiment, the block polymer may comprise:

- a first block with a T_g of between 20 and 40°C, for example with a T_g of 25 to 39°C, which is a copolymer comprising at least one methyl acrylate monomer, at least one methyl methacrylate monomer and at least one acrylic acid monomer,
- a second block with a T_g of greater than or equal to 40°C, for example ranging from 85 to 125°C, which is a homopolymer composed of methyl methacrylate monomers, and
- an intermediate block comprising at least one methyl acrylate, methyl methacrylate monomer, and
- an intermediate block comprising methyl methacrylate, at least one acrylic acid monomer and at least one methyl acrylate monomer.

[0196] According to a second variant of this second embodiment, the block polymer may comprise:

- a first block with a T_g of between 20 and 40°C, for example with a T_g of 21 to 39°C, which is a copolymer comprising isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate,
- a second block with a T_g of less than or equal to 20°C, for example ranging from -65 to -35°C, which is a methyl methacrylate homopolymer, and
- an intermediate block which is an isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate random copolymer.

[0197] According to a third variant of this second embodiment, the block polymer may comprise:

- a first block with a T_g of between 20 and 40°C, for example with a T_g from 21 to 39°C, which is an isobornyl acrylate/methyl acrylate/acrylic acid copolymer,
- a second block with a T_g of greater than or equal to 40°C, for example ranging from 85 to 115°C, which is an isobornyl acrylate homopolymer, and
- an intermediate block which is an isobornyl acrylate/methyl acrylate/acrylic acid random copolymer.

As a non-limiting illustration, the polymers corresponding to this second embodiment may be prepared as follows.

Example 7: Preparation of a poly(isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate) polymer

[0198] 100 g of isododecane are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 90°C over 1 hour. 54 g of isobornyl acrylate, 75.6 g of isobutyl methacrylate, 50.4 g of 2-ethylhexyl acrylate, 110 g of isododecane and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trig-
onox® 141 from Akzo Nobel) are then added, at 90°C and over 1 hour. This mixture is maintained at 90°C for 1 hour 30 minutes.

[0199] 120 g of 2-ethylhexyl acrylate, 90 g of isododecane and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 90°C and over 1 hour.

[0200] The mixture is maintained at 90°C for 3 hours and is then diluted and cooled.

[0201] A solution containing 50% polymer active material in isododecane is obtained.

[0202] The polymer obtained comprises a poly(isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate) first block with a Tg of 25°C, a poly(2-ethylhexyl acrylate) second block with a Tg of -50°C and an intermediate block which is an isobornyl acrylate/isobutyl methacrylate/2-ethylhexyl acrylate random polymer.

Example 8: Preparation of a poly(methyl methacrylate/methyl acrylate/acrylic acid) polymer

[0203] 210 g of ethyl acetate are introduced into a 1 litre reactor and the temperature is then increased so as to pass from room temperature (25°C) to 78°C over 1 hour. 54 g of methyl methacrylate, 21 g of acrylic acid, 135 g of methyl acrylate and 1.8 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane (Trigonox® 141 from Akzo Nobel) are then added, at 78°C and over 1 hour.

[0204] The mixture is maintained at 90°C for 1 hour.

[0205] 90 g of methyl methacrylate, 90 g of ethyl acetate and 1.2 g of 2,5-bis(2-ethylhexanoylperoxy)-2,5-dimethylhexane are then introduced into the above mixture, still at 78°C and over 1 hour.

[0206] The mixture is maintained at 78°C for 3 hours and is then diluted with 150 g of ethyl acetate and cooled.

[0207] A solution containing 40% polymer active material in ethyl acetate is obtained.

[0208] The polymer obtained comprises a poly(methyl acrylate/methyl methacrylate/acrylic acid) first block with a Tg of 35°C, a poly(methyl methacrylate) second block with a Tg of 100°C and an intermediate block which is a methyl methacrylate/acrylic acid/polymethyl acrylate random polymer.

[0209] This polymer has a weight-average mass of 141 000 and a number-average mass of 50 000, i.e. a polydispersity index I of 2.82.

[0210] Preferably, the composition according to the invention is a leave-in composition.

[0211] Generally, the first composition of the product of the invention contains from 0.1% to 60% by weight of active material (or of solids) of block polymer, preferably from 0.5% to 50% by weight and more preferably from 1% to 40% by weight.

Second composition

[0212] The cosmetic product according to the invention contains a second composition comprising a second cosmetically acceptable medium.

[0213] When the cosmetic product of the invention is a makeup product, the second composition may be any cosmetic makeup composition known to those skilled in the art. In particular, the second composition may be a lipstick, a mascara, a gloss, an eyeshadow, a foundation or a nail varnish.

[0214] The second composition is advantageously chosen such that it improves at least one cosmetic property of the first composition, when the first composition is applied alone to the said keratin material. For example, the second composition may improve the comfort of the first composition or reduce its tacky nature.

[0215] The second composition may also be chosen such that the product, once applied to the keratin materials, has satisfactory transfer-resistance, gloss and staying-power properties.

[0216] In particular, the mean gloss measured at 20° of the first composition, once spread onto a support, is greater than or equal to 30, preferably greater than or equal to 40, preferably greater than or equal to 50 and preferentially greater than or equal to 60 out of 100.

[0217] According to one embodiment, the mean gloss of the product measured at 20°, the product being spread onto a support, is greater than or equal to 30, preferably greater than or equal to 40, preferably greater than or equal to 50 and preferentially greater than or equal to 60 out of 100.

Mean gloss

[0218] The term "mean gloss" means the gloss as may be conventionally measured using a glossmeter by the following method.

[0219] A coat of between 50 µm and 150 µm in thickness of a composition is spread using an automatic spreader onto a Leneta brand contrast card of reference Form 1A Penopac. The composition may be the first or the second composition. The coat covers at least the white background of the card. The deposit is left to dry for 24 hours at a temperature of 30°C, and the gloss at 20° is then measured on the white background using a Byk Gardner brand glossmeter of reference microTri-Gloss.

[0220] This measurement (between 0 and 100) is repeated at least three times, and the mean gloss is the mean of the at least three measurements taken.

[0221] When it is desired to measure the gloss of the product according to the invention, a first coat of one of the two compositions is spread onto the contrast card, under the same conditions as described previously. This first coat

is left to dry, and a second coat of the other composition is then spread on top, under the same conditions as described previously.

[0222] The mean gloss of the first composition, or of the second composition, or of the product of the invention, measured at 20° is advantageously greater than or equal to 30, better still greater than or equal to 35, even better still greater than or equal to 40, even better still greater than or equal to 45, even better still greater than or equal to 50 out of 100, even better still greater than or equal to 55, even better still greater than or equal to 60, even better still greater than or equal to 65, even better still greater than or equal to 70 or, even better still, greater than or equal to 75 out of 100. For certain compositions according to the invention, such as nail varnishes, the gloss measured at 20° may be greater than or equal to 70, or even 80 out of 100.

[0223] Preferably, the mean gloss of the first composition, or of the second composition, or of the product of the invention, once spread onto a support, measured at 60° is greater than or equal to 50, better still greater than or equal to 60, better still greater than or equal to 65, better still greater than or equal to 70, better still greater than or equal to 75, better still greater than or equal to 80, better still greater than or equal to 85 or, better still, greater than or equal to 90 out of 100.

[0224] The measurement of the mean gloss at 60° is performed under the same conditions as those described previously to measure the mean gloss at 20°.

[0225] The first composition and/or the second composition may also be chosen such that the product, once applied to the keratin materials, has satisfactory transfer-resistant, gloss and staying-power properties.

[0226] In particular, the first composition preferably has a transfer index of less than 40, preferably less than or equal to 30, preferably less than or equal to 20, preferably less than or equal to 15, preferably less than or equal to 10, preferably less than or equal to 5 and more preferably less than or equal to 2 out of 100.

[0227] The second composition may be chosen such that the transfer index of the product of the invention is less than or equal to 40, preferably less than or equal to 30, preferably less than or equal to 20, preferably less than or equal to 15, preferably less than or equal to 10 and preferentially less than or equal to 5.

Transfer Index

[0228] The transfer index may be measured according to the following method.

[0229] A support (rectangle of 40 mm x 70 mm and 3 mm thick) of polyethylene foam that is adhesive on one of the faces, having a density of 33 kg/m³ (sold under the name RE40X70EP3 from the company Joint Technique Lyonnais Ind) is preheated on a hotplate maintained at a temperature of 40°C in order for the surface of the support to be maintained at a temperature of 33°C ± 1°C.

[0230] When it is desired to measure the transfer index of the first composition, the first composition is applied over the entire non-adhesive surface of the support, by spreading it using a fine brush to obtain a deposit of about 15 µm of the composition, while leaving the support on the hotplate, and the support is then left to dry for 30 minutes.

[0231] When it is desired to measure the transfer index of the product of the invention, the first composition is applied over the entire non-adhesive surface of the support, by spreading it using a fine brush to obtain a deposit of about 15 µm of the composition, while leaving the support on the hotplate, and the support is then dried for 30 minutes. The second composition is then applied.

[0232] After drying, the support (coated with the first composition or the product) is bonded via its adhesive face onto an anvil of diameter 20 mm and equipped with a screw pitch. The support/deposit assembly is then cut up using a punch 18 mm in diameter. The anvil is then screwed onto a press (Statif Manuel Imada SV-2 from the company Someco) equipped with a tensile testing machine (Imada DPS-20 from the company Someco).

[0233] White photocopier paper of 80 g/m² is placed on the bed of the press and the support/deposit assembly is then pressed on the paper at a pressure of 2.5 kg for 30 seconds. After removing the support/deposit assembly, some of the deposit is transferred onto the paper. The colour of the deposit transferred onto the paper is then measured using a Minolta CR300 colorimeter, the colour being characterized by the L*, a*, b* colorimetric parameters. The colorimetric parameters L*, a* and b* of the colour of the plain paper used is determined.

[0234] The difference in colour ΔE1 between the colour of the deposit transferred relative to the colour of the plain paper is then determined by means of the following relationship.

$$\Delta E1 = \sqrt{(L^* - L_0^*)^2 + (a^* - a_0^*)^2 + (b^* - b_0^*)^2}$$

[0235] Moreover, a total transfer reference is prepared by applying the composition or the product directly onto a paper identical to the one used previously, at room temperature (25°C), by spreading the composition using a fine brush and so as to obtain a deposit of about 15 µm of the composition, and the deposit is then left to dry for 30 minutes at room temperature (25°C). After drying, the colorimetric parameters L*, a* and b* of the colour of the deposit placed

on the paper, corresponding to the reference colour of total transfer, is measured directly. The colorimetric parameters L^*_{00} , a^*_{00} and b^*_{00} of the colour of the plain paper used are determined.

[0236] The difference in colour $\Delta E2$ between the reference colour of total transfer relative to the colour of the plain paper are then determined by means of the following relationship.

$$\Delta E2 = \sqrt{(L^* - L^*_{00})^2 + (a^* - a^*_{00})^2 + (b^* - b^*_{00})^2}$$

[0237] The transfer of the composition or of the product, expressed as a percentage, is equal to the ratio:

$$100 \times \Delta E1 / \Delta E2$$

[0238] The measurement is performed on 4 supports in succession and the transfer value corresponds to the mean of the 4 measurements obtained with the 4 supports. The transfer index is equal to the mean of these 4 measurements.

Organic liquid medium

[0239] The organic medium of the first composition may comprise any cosmetically acceptable, and in general cosmetically acceptable, oil, chosen especially from carbon-based oils, hydrocarbon-based oils, fluoro oils and/or silicone oils of mineral, plant or synthetic origin, alone or as a mixture provided that they form a uniform and macroscopically stable mixture and that they are compatible with the intended use.

[0240] The organic medium of the first composition may represent from 5% to 90% of the total weight of the composition and preferably from 20% to 85%. Advantageously, it represents at least 30% of the total weight of the composition.

[0241] According to one embodiment, the organic medium comprises one or more volatile oils.

[0242] These oils may be hydrocarbon-based oils or silicone oils optionally comprising alkyl or alkoxy groups that are pendent or at the end of a silicone chain.

[0243] As volatile silicone oils that may be used in the invention, mention may be made of linear or cyclic silicones with a viscosity at room temperature of less than 8 cSt and especially containing from 2 to 7 silicon atoms, these silicones optionally comprising alkyl or alkoxy groups containing from 1 to 10 carbon atoms. As volatile silicone oils that may be used in the invention, mention may be made especially of octamethylcyclotetrasiloxane, decamethylcyclopenta-siloxane, dodecamethylcyclohexasiloxane, heptamethylhexyltrisiloxane, heptamethyloctyltrisiloxane, octamethyltrisiloxane and decamethyltetrasiloxane, and mixtures thereof.

[0244] As other volatile oils that may be used in the invention, C_8 - C_{16} isoalkane oils (also known as isoparaffins), for instance isododecane, isodecane and isohexadecane and, for example, the oils sold under the trade names Isopar and Permethyl, and especially isododecane (Permethyl 99A), are especially preferred.

[0245] The volatile oils especially represent from 5% to 85% and better still from 20% to 75% of the total weight of the composition.

[0246] According to one embodiment, the fatty phase comprises at least one apolar or sparingly polar non-volatile oil.

[0247] As sparingly polar non-volatile oil that may be used in the invention, mention may be made of apolar oils or, especially, oils comprising an alkyl chain especially of C_3 - C_{40} . Examples of apolar or sparingly polar oils that may be mentioned include:

- linear or branched hydrocarbons such as liquid paraffin, liquid petroleum jelly and light naphthas, and hydrogenated polyisobutene;
- hydrocarbon-based oils of animal origin, for instance squalene;
- fatty alcohols;
- hydrocarbon-based plant oils such as liquid triglycerides of fatty acids of at least 10 carbon atoms;
- synthetic esters and ethers, especially of fatty acids, for instance the oils of formula $R_1CO(O)_xR_2$ in which R_1 represents an acid residue containing from 2 to 29 carbon atoms with x being 0 or 1 and R_2 represents a hydrocarbon-based chain containing from 3 to 30 carbon atoms, for instance tributyl acetyl citrate, oleyl erucate, 2-octyldodecyl behenate, triisooarachidyl citrate, isocetyl stearylstearate or octyldodecanyl stearylstearate, n-propyl acetate, tridecyl trimellitate, diisocetyl dodecanedioleate or stearate, arachidyl propionate, dibutyl phthalate, propylene carbonate or octyldodecyl pentanoate; polyol esters, for instance vitamin F, sorbitan isostearate and glyceryl or diglyceryl triisostearate;
- silicone oils such as polydimethylsiloxanes (PDMS), optionally comprising a C_3 - C_{40} alkyl or alkoxy chain or a phenylated chain, such as optionally fluorinated phenyltrimethicones and polyalkylmethylsiloxanes, for instance

polymethyltrifluoropropyl dimethylsiloxanes, or with functional groups such as hydroxyl, thiol and/or amine groups; polysiloxanes modified with fatty acids, fatty alcohols or polyoxyalkylenes,

- fluoro oils;
- mixtures thereof.

[0248] These apolar or sparingly polar non-volatile oils may represent from 0.1% to 20% of the total weight of the composition, better still from 0.5% to 10% and even better still from 1% to 5% of the total weight of the composition.

[0249] The non-volatile oil is advantageously chosen from hydrocarbons, especially alkanes such as hydrogenated polyisobutene, and from phenylsilicone oils, and mixtures thereof.

[0250] The phenylsilicone oils that may be used according to the present invention preferably have a viscosity, measured at 25°C and atmospheric pressure, ranging from 5 to 100 000 cSt and preferably from 5 to 10 000 cSt.

[0251] The silicone oil may be, for example, a phenyl trimethicone, a phenyl dimethicone, a phenyltrimethylsiloxy-diphenylsiloxane, a diphenyl dimethicone, a diphenylmethyl diphenyltrisiloxane or a mixture of various phenylsilicone oils, and in particular may correspond to formula (A) below:

in which

- R_9 and R_{12} are each independently a C_1 - C_{30} alkyl radical, an aryl radical or an aralkyl radical,
- R_{10} and R_{11} are each independently a C_1 - C_{30} alkyl radical or an aralkyl radical,
- u , v , w and x are each independently integers ranging from 0 to 900,

with the proviso that the sum $v + w + x$ is other than 0 and that the sum $u + v + w + x$ ranges from 1 to 900; in particular $u + v + w + x$ ranges from 1 to 800.

[0252] Advantageously, R_9 is a C_1 - C_{20} alkyl radical, a phenyl radical or an aralkyl radical of the type $R'-C_6H_5$, R' being a C_1 - C_5 alkyl, R_{10} and R_{11} are each independently a C_1 - C_{20} alkyl radical or an aralkyl radical of the type $R'-C_6H_5$, R' being a C_1 - C_5 alkyl, and R_{12} is a C_1 - C_{20} alkyl radical.

[0253] Preferably, R_9 is a methyl, ethyl, propyl, isopropyl, decyl, dodecyl or octadecyl radical, or alternatively a phenyl, tolyl, benzyl or phenethyl radical, R_{10} and R_{11} are each independently a methyl, ethyl, propyl, isopropyl, decyl, dodecyl or octadecyl radical, or alternatively a tolyl, benzyl or phenethyl radical, and R_{12} is a methyl, ethyl, propyl, isopropyl, decyl, dodecyl or octadecyl radical.

[0254] Preferably, the phenylsilicone oil is an oil of low viscosity of formula (A) with the sum $u + v + w + x$ ranging from 1 to 150 and better still from 1 to 100, or even from 1 to 50.

[0255] In particular, the low-viscosity phenylsilicone oil satisfies formula (III) below:

in which

- R_8 is a C_1 - C_{30} alkyl radical, an aryl radical or an aralkyl radical,
- n is an integer ranging from 0 to 100 and better still less than 100,
- m is an integer ranging from 0 to 100, with the proviso that the sum $m + n$ ranges from 1 to 100 and better still is less than 100.

[0256] Advantageously, R_8 is a C_1 - C_{20} alkyl radical, a phenyl radical or an aralkyl radical of the type $R'-C_6H_5$, R' being a C_1 - C_5 alkyl.

[0257] Preferably, R_8 is a methyl, ethyl, propyl, isopropyl, decyl, dodecyl or octadecyl radical, or alternatively a phenyl, tolyl, benzyl or phenethyl radical. Advantageously, R_8 is a methyl radical.

[0258] Among the low-viscosity phenylsilicone oils that may be used in the invention, mention may be made of the oils DC556 (22.5 cSt) and SF558 (10-20 cSt) from Dow Corning, the oil Abil AV8853 (4-6 cSt) from Goldschmidt, the oil Silbione 70 633 V 30 (28 cSt) from Rhone-Poulenc, the oils 15 M 40 (50 to 100 cSt) and 15 M 50 (20 to 25 cSt) from PCR, the oils SF 1550 (25 cSt) and PK 20 (20 cSt) from Bayer, the oil Belsil PDM 200 (200 cSt) from Wacker, and the oils KF 53 (175 cSt), KF 54 (400 cSt) and KF 56 (14 cSt) from Shin-Etsu. The values in parentheses represent the viscosities at 25°C.

[0259] The organic medium may also contain a polar oil chosen from fatty acid esters of 7 to 29 carbon atoms, for instance diisostearyl malate, isopropyl palmitate, diisopropyl adipate, caprylic/capric acid triglycerides such as those sold by the company Stearineries Dubois or those sold under the names Miglyol 810, 812 and 818 by the company Dynamit Nobel, Shea butter oil, isopropyl myristate, butyl stearate, hexyl laurate, diisopropyl adipate, isononyl isononate, 2-hexyldecyl laurate, 2-octyldecyl palmitate, 2-octyldodecyl myristate or lactate, 2-diethylhexyl succinate, 2-ethylhexyl palmitate, 2-octyldodecyl stearate or castor oil; esters of lanolic acid, of lauric acid or of stearic acid; higher fatty alcohols (of 7 to 29 carbon atoms) such as stearyl alcohol, linoleyl alcohol, linolenyl alcohol, isostearyl alcohol, 2-octyldodecanol, decanol, dodecanol, octadecanol or oleyl alcohol; higher fatty acids (of 7 to 29 carbon atoms) such as myristic acid, palmitic acid, stearic acid, behenic acid, oleic acid, linoleic acid, linolenic acid or isostearic acid; mixtures thereof.

[0260] These non-volatile polar oils may represent from 0.1% to 10% and better still from 1% to 5% of the total weight of the composition.

[0261] When the first or the second composition is intended to be applied to the nails, the cosmetically acceptable medium preferably contains a solvent chosen from:

- ketones that are liquid at room temperature, such as methyl ethyl ketone, methyl isobutyl ketone, diisobutyl ketone, isophorone, cyclohexanone or acetone;
- alcohols that are liquid at room temperature, such as ethanol, isopropanol, diacetone alcohol, 2-butoxyethanol or cyclohexanol;
- glycols that are liquid at room temperature, such as ethylene glycol, propylene glycol, pentylene glycol or glycerol;
- propylene glycol ethers that are liquid at room temperature, such as propylene glycol monomethyl ether, propylene glycol monomethyl ether acetate or dipropylene glycol mono-n-butyl ether;
- cyclic ethers such as γ -butyrolactone;
- short-chain esters (containing from 3 to 8 carbon atoms in total) such as ethyl acetate, methyl acetate, propyl acetate, isopropyl acetate, n-butyl acetate, isopentyl acetate, methoxypropyl acetate or butyl lactate;

- ethers that are liquid at room temperature, such as diethyl ether, dimethyl ether or dichlorodiethyl ether;
- alkanes that are liquid at room temperature, such as decane, heptane, dodecane or cyclohexane;
- alkyl sulfoxides such as dimethyl sulfoxide;
- aldehydes that are liquid at room temperature, such as benzaldehyde or acetaldehyde;
- 5 - heterocyclic compounds such as tetrahydrofuran;
- propylene carbonate or ethyl 3-ethoxypropionate;
- mixtures thereof.

[0262] Methyl acetate, isopropyl acetate, methoxypropyl acetate, butyl lactate, acetone, methyl ethyl ketone, diacetone alcohol, γ -butyrolactone, tetrahydrofuran, propylene carbonate, ethyl 3-ethoxypropionate and dimethyl sulfoxide, and mixtures thereof, are particularly preferred.

[0263] The first composition may comprise, besides the block polymer, an additional polymer such as a film-forming polymer. The second composition may also contain a film-forming polymer. According to the present invention, the term "film-forming polymer" means a polymer capable of forming, by itself or in the presence of an auxiliary film-forming agent, a continuous film that adheres to a support, especially to keratin materials.

[0264] Among the film-forming polymers that may be used in the composition of the present invention, mention may be made of synthetic polymers, of free-radical type or of polycondensate type, and polymers of natural origin, and mixtures thereof.

[0265] The film-forming polymer may be chosen in particular from cellulose-based polymers such as nitrocellulose, cellulose acetate, cellulose acetobutyrate, cellulose acetopropionate or ethylcellulose, or from polyurethanes, acrylic polymers, vinyl polymers, polyvinyl butyrals, alkyd resins, resins derived from aldehyde condensation products, such as arylsulfonamide-formaldehyde resins, for instance toluenesulfonamide-formaldehyde resin, and arylsulfonamide epoxy resins.

[0266] Film-forming polymers that may especially be used include nitrocellulose RS 1/8 sec.; RS 1/4 sec.; 1/2 sec.; RS 5 sec.; RS 15 sec.; RS 35 sec.; RS 75 sec.; RS 150 sec.; AS 1/4 sec.; AS 1/2 sec.; SS 1/4 sec.; SS 1/2 sec.; SS 5 sec., sold especially by the company Hercules; the toluenesulfonamide-formaldehyde resins "Ketjentflex MS80" from the company Akzo or "Santolite MHP" and "Santolite MS80" from the company Faconnier or "Resimpol 80" from the company Pan Americana, the alkyd resin "Beckosol Ode 230-70-E" from the company Dainippon, the acrylic resin "Acryloid B66" from the company Rohm & Haas, and the polyurethane resin "Trixene PR 4127" from the company Baxenden.

[0267] The additional film-forming polymer may be present in the composition according to the invention in a content ranging from 0.1% to 60% by weight, preferably ranging from 2% to 40% by weight and better still from 5% to 25% by weight, relative to the total weight of the composition.

[0268] The first or the second composition may also comprise at least one plasticizer. The amount of plasticizer may be chosen by a person skilled in the art on the basis of his general knowledge, so as to obtain a composition with cosmetically acceptable properties.

[0269] The first composition according to the invention may also comprise, depending on the intended type of application, at least one wax.

[0270] For the purposes of the present invention, a wax is a lipophilic fatty compound, that is solid at room temperature (25°C), with a reversible solid/liquid change of state, having a melting point of greater than 40°C which may be up to 200°C, and having an anisotropic crystal organization in the solid state.

[0271] Linear hydrocarbon-based waxes are preferred in the context of the present invention. Their melting point is advantageously greater than 35°C, for example greater than 55°C and preferably greater than 80°C.

[0272] The linear hydrocarbon-based waxes are advantageously chosen from substituted linear alkanes, unsubstituted linear alkanes, unsubstituted linear alkenes and substituted linear alkenes, an unsubstituted compound being a compound of carbon and hydrogen exclusively. The substituents mentioned above do not contain any carbon atoms.

[0273] The linear hydrocarbon-based waxes include ethylene polymers and copolymers with a molecular weight of between 400 and 800, for example Polywax 500 or Polywax 400 sold by New Phase Technologies.

[0274] The linear hydrocarbon-based waxes include linear paraffin waxes, for instance the paraffins S&P 206, S&P 173 and S&P 434 from Strahl & Pitsch.

[0275] The linear hydrocarbon-based waxes include long-chain linear alcohols, for instance products comprising a mixture of polyethylene and of alcohols containing 20 to 50 carbon atoms, for instance Performacol 425 or Performacol 550 (mixture in 20/80 proportions) sold by New Phase Technologies.

[0276] The waxes may be present in a proportion of 0.5-30%, better still from 5% to 20% and preferably between 5% and 15% by weight in the first composition, so as not to excessively reduce the gloss of the composition and of the film applied to the lips and/or the skin.

[0277] The cosmetically acceptable medium of the second composition preferably comprises a liquid phase that is non-volatile at room temperature and atmospheric pressure.

[0278] The term "non-volatile liquid phase" means any medium capable of remaining on the skin or the lips for several

hours. A non-volatile liquid phase in particular has a non-zero vapour pressure at room temperature and atmospheric pressure, of less than 0.02 mmHg (2.66 Pa) and better still less than 10^{-3} mmHg (0.13 Pa).

[0279] The non-volatile liquid phase of the second composition may be at least one hydrocarbon-based oil, a liquid silicone phase, a fluoro phase that is liquid at room temperature, or a mixture thereof.

[0280] The term "hydrocarbon-based oil" means oils mainly containing carbon atoms and hydrogen atoms, and in particular alkyl or alkenyl chains; for instance alkanes or alkenes, but also oils containing an alkyl or alkenyl chain comprising one or more ether, ester or carboxylic acid groups.

[0281] The non-volatile liquid phase of the second composition advantageously represents 1% to 100%, preferably from 5% to 95%, better still from 20% to 80% and even better still from 40% to 80% of the total weight of the second composition.

[0282] The non-volatile liquid phase of the second composition advantageously contains a silicone oil, for example a phenylsilicone oil or a polydimethylsiloxane oil.

[0283] The non-volatile silicone oil may be chosen from polyalkylsiloxanes, polyarylsiloxanes and polyalkylarylsiloxanes, and mixtures thereof.

[0284] The non-volatile silicone oil may be chosen from:

- linear or branched non-volatile polydimethylsiloxanes (PDMS);
- polydimethylsiloxanes comprising alkyl, alkoxy or phenyl groups, which are pendent or at the end of a silicone chain, these groups containing from 2 to 24 carbon atoms;
- phenylsilicones, for instance phenyl trimethicones, phenyl dimethicones, phenyltrimethylsiloxydiphenylsiloxanes, diphenyl dimethicones, diphenylmethylphenyltrisiloxanes and 2-phenylethyl trimethylsiloxyisilicates.

[0285] The polyalkylsiloxanes according to the invention include polydimethylsiloxanes, (polydimethylsiloxane) (methylvinylsiloxane) copolymers, poly(dimethylsiloxane)(diphenyl)siloxanes, poly(dimethylsiloxane)(diphenyl)(methylvinylsiloxane) copolymers, and mixtures thereof.

[0286] The non-volatile silicone oil that is preferred is an oil chosen from the silicones of formula (II):

(ii)

in which:

R₁, R₂, R₅ and R₆ are, together or separately, an alkyl radical containing 1 to 6 carbon atoms,

R₃ and R₄ are, together or separately, an alkyl radical containing from 1 to 6 carbon atoms or an aryl radical, X is an alkyl radical containing from 1 to 6 carbon atoms, a hydroxyl radical or a vinyl radical,

n and p being chosen so as to give the oil a weight-average molecular mass of less than 200 000 g/mol, preferably less than 150 000 g/mol and more preferably less than 100 000 g/mol.

[0287] A polydimethylsiloxane with a viscosity of between 0.5 and 60 000 cSt, preferably between 0.5 and 10 000 cSt and preferentially between 0.5 and 1000 cSt measured according to ASTM standard D-445, for example DC 200 of viscosity 350 cSt sold by Dow Corning, is chosen, for example, as non-volatile silicone of formula (II).

[0288] According to one embodiment, the second composition contains a non-volatile silicone of formula (II) such as a polydimethylsiloxane with a viscosity preferably of between 0.5 and 500 cSt and more preferably between 1 and 10 cSt, for example the polydimethylsiloxane sold under the name DC 200 of viscosity 5 cSt and of molecular weight 800, sold by Dow Corning.

[0289] The weight-average molecular mass of the silicone oil is preferably between 400 and 200 000, preferably between 4000 and 100 000, preferably between 4000 and 20 000, preferably between 400 and 2000 and more preferably between 400 and 1000 g/mol.

[0290] According to one embodiment, the second composition advantageously contains a mixture of a polydimethylsiloxane with a molecular mass of between 200 000 and 300 000 g/mol and a polydimethylsiloxane with a molecular mass of between 400 and 1000 g/mol.

[0291] The mass proportion of the silicone compound of high molecular weight/liquid silicone compound is preferably between 20/80 and 60/40 and preferentially between 35/65 and 45/55.

[0292] Preferably, the non-volatile liquid phase of the second composition comprises at least one fluoro oil of formula (III):

in which:

- R represents a linear or branched divalent alkyl group containing 1 to 6 carbon atoms, preferably a divalent methyl, ethyl, propyl or butyl group,
- Rf represents a fluoroalkyl radical, especially a perfluoroalkyl radical, containing 1 to 9 carbon atoms, preferably 1 to 4 carbon atoms,
- R₁ represent, independently of each other, a C₁-C₂₀, preferably C₁-C₄ alkyl radical, a hydroxyl radical or a phenyl radical,
- m is chosen from 0 to 150 and preferably from 20 to 100, and
- n is chosen from 1 to 300 and preferably from 1 to 100.

[0293] The oils of formula (III) such that R₁ is a methyl, R is an ethyl and Rf is CF₃ are preferred. Fluorosilicone compounds of formula (III) that may especially be mentioned are those sold by the company Shin Etsu under the names "X22-819", "X22-820", "X22-821" and "X22-822" or "FL-100".

[0294] Among the fluoro oils that may also be mentioned are the fluoro polyethers chosen from the compounds of formula (IV) below:

in which:

- R₃ to R₆ represent, independently of each other, a monovalent radical chosen from -F, -(CF₂)_n-CF₃ and -O-(CF₂)_n-CF₃,
- R₇ represents a monovalent radical chosen from -F and -(CF₂)_n-CF₃,
- with n ranging from 0 to 4 inclusive,
- p ranging from 0 to 600, q ranging from 0 to 860, r ranging from 0 to 1500, and p, q and r being integers chosen such that the weight-average molecular mass of the compound ranges from 500 to 100 000 and preferably from 500 to 10 000.

[0295] The fluoro oils may also be chosen from fluoroalkanes chosen from C₂-C₅₀ and preferably C₅-C₃₀ perfluoroalkanes and fluoroalkanes, such as perfluorodecalin, perfluoroadamantane and bromoperfluorooctyl, and mixtures thereof.

[0296] The second composition may optionally contain a volatile oil.

[0297] These oils may be hydrocarbon-based oils or silicone oils optionally comprising alkyl or alkoxy groups that are pendent or at the end of a silicone chain, or a mixture of these oils.

[0298] Preferably, the volatile oils are cosmetic oils chosen from oils with a flash point ranging from 40°C to 100°C, and mixtures thereof. In addition, they advantageously have a boiling point at atmospheric pressure of less than 220°C and better still less than 210°C, especially ranging from 110 to 210°C. Preferably, these volatile oils are not monoalcohols containing at least 7 carbon atoms.

[0299] As volatile oils that may be used in the invention, mention may be made of linear or cyclic silicone oils with a viscosity at room temperature of less than 8 cSt and especially containing from 2 to 7 silicon atoms, these silicones optionally comprising alkyl or alkoxy groups of 1 to 10 carbon atoms. As volatile silicone oils that may be used in the invention, mention may be made especially of octamethylcyclotetrasiloxane, decamethylcyclopentasiloxane, dodecamethylcyclohexasiloxane, heptamethylhexyltrisiloxane, heptamethyloctyltrisiloxane, hexamethyldisiloxane, octamethyltrisiloxane, decamethyltetrasiloxane and dodecamethylpentasiloxane, and mixtures thereof.

[0300] As other volatile oils that may be used in the invention, mention may be made of hydrocarbon-based volatile oils containing from 8 to 16 carbon atoms and mixtures thereof, and especially C₈-C₁₆ branched alkanes, for instance C₈-C₁₆ isoalkanes (also known as isoparaffins), isododecane, isodecane and isohexadecane, and for example the oils sold under the trade names Isopar or Permethyl, and C₈-C₁₆ branched esters, for instance isohexyl neopentanoate, and mixtures thereof.

[0301] Isododecane (Permethyl 99 A), C₈-C₁₆ isoparaffins, for instance Isopar L, E, G or H, and mixtures thereof, optionally combined with decamethyltetrasiloxane or with cyclopentasiloxane, are preferably used.

[0302] In general, the amount of volatile oil is used in an amount that is sufficient to improve the spreading qualities of the second composition. This amount will be adapted by a person skilled in the art as a function of the intensity of the desired properties.

[0303] The amount of volatile oil is chosen so that it does not reduce the gloss of the second composition. According to one embodiment, the second composition contains no volatile oil.

[0304] The second composition advantageously contains a high molecular weight polymer that is different from the non-volatile silicone oil described above.

[0305] When the second composition according to the invention is liquid, it advantageously comprises 20% to 50% by weight of a high molecular weight polymer.

[0306] When the second composition according to the invention is solid, it advantageously comprises 2% to 40% by weight of a high molecular weight polymer.

[0307] The polymer is preferably a silicone polymer.

[0308] This polymer may be liquid or solid at room temperature and its weight-average molecular mass is greater than or equal to 200 000 g/mol, preferably between 200 000 and 2 500 000 and preferentially between 200 000 and 2 000 000 g/mol.

[0309] The viscosity of this polymer may be between 10 000 and 5 000 000 cSt, preferably between 100 000 and 1 000 000 cSt and more preferably between 300 000 and 700 000 cSt, measured according to ASTM standard D-445.

[0310] The high molecular weight polymer is advantageously an ungrafted polymer, i.e. a polymer obtained by polymerizing at least one monomer, without subsequent reaction of the side chains with another chemical compound. The polymer is preferably chosen from dimethiconols, fluorosilicones, dimethicones and mixtures thereof. The polymer is preferably a homopolymer.

[0311] In particular, the polymer that may be used is a high molecular weight polymer corresponding to formula (V):

in which:

R₁, R₂, R₅ and R₆ are, together or separately, an alkyl radical containing 1 to 6 carbon atoms, optionally substituted

with at least one fluorine atom,

R_3 and R_4 are, together or separately, an alkyl radical containing from 1 to 6 carbon atoms or an aryl radical, X is an alkyl radical containing from 1 to 6 carbon atoms, a hydroxyl radical, a vinyl or allyl radical or an alkoxy radical containing from 1 to 6 carbon atoms,

n and p being chosen such that the silicone compound has a weight-average molecular mass of greater than or equal to 200 000 g/mol.

[0312] p is preferably equal to 0.

[0313] The polymers of formula (V) such that R_1 to R_6 represent a methyl group and the substituent X represents a hydroxyl group are dimethiconols. Examples that are mentioned include the polymers of formula (V) such that $p = 0$ and n is between 2000 and 40 000 and preferably between 3000 and 30 000. Mention may also be made of polymers with a molecular mass of between 1 500 000 and 2 000 000 g/mol.

[0314] According to one embodiment, the high molecular weight polymer is the dimethiconol sold by Dow Corning in a polydimethylsiloxane (5 cSt) under the reference D2-9085, the viscosity of the mixture being equal to 1550 cSt, or the dimethiconol sold by Dow Corning in a polydimethylsiloxane (5 cSt) under the reference DC 1503. The dimethiconol (of molecular weight equal to 1 770 000 g/mol) sold by Dow Corning under the reference Q2-1403 or Q2-1401, the viscosity of the mixture being equal to 4000 cSt, is also preferred.

[0315] As high molecular weight polymers that may be used according to the invention, mention may be made of those for which:

- the substituents R_1 to R_6 and X represent a methyl group, for instance the product sold under the name SE30 by the company General Electric, and the product sold under the name AK 500 000 by the company Wacker,
- the substituents R_1 to R_6 and X represent a methyl group and p and n are such that the molecular weight is 250 000 g/mol, for instance the product sold under the name Silbione 70047 V by the company Rhodia,
- the substituents R_1 to R_6 represent a methyl group and the substituent X represents a hydroxyl group, for instance the products sold under the name Q2-1401 or Q2-1403 by the company Dow Corning,
- the substituents R_1 , R_2 , R_5 , R_6 and X represent a methyl group, the substituents R_3 and R_4 represent an aryl group and n and p are such that the molecular weight of the polymer is 600 000 g/mol, for instance the product sold under the name 761 by the company Rhone-Poulenc.

[0316] The high molecular weight silicone polymer is preferably introduced into the composition in the form of a mixture with a liquid silicone, the viscosity of the said liquid silicone being between 0.5 and 10 000 cSt, preferably between 0.5 and 500 cSt and more preferably between 1 and 10 cSt.

[0317] The fluid silicone may be chosen from polyalkylsiloxanes, polyarylsiloxanes, polyalkylarylsiloxanes and mixtures thereof. The liquid silicone may be a volatile silicone such as a cyclic polydimethylsiloxane comprising 3 to 7 $-(CH_3)_2SiO-$ units.

[0318] The liquid silicone may also be a non-volatile polydimethylsiloxane silicone, especially with a viscosity of between 0.5 and 10 000 cSt and more preferably of the order of 5 cSt, for example the silicone sold under the reference DC 200 by Dow Corning.

[0319] The proportion of the high molecular weight silicone polymer in the high molecular weight silicone polymer/liquid silicone mixture is preferably between 10/90 and 20/80. The viscosity of the high molecular weight silicone polymer/liquid silicone mixture is preferably between 1000 and 10 000 cSt.

[0320] The high molecular weight dimethicones according to the invention include the dimethicones described in patent US 4 152 416. They are sold, for example, under the references SE30, SE33, SE54 and SE76.

[0321] The dimethicones according to the invention are, for example, compounds of formula (III) such that R_1 to R_6 and X are methyls and $p = 0$. The molecular weight of these polymers is preferably between 200 000 and 300 000 and preferentially between 240 000 and 260 000 g/mol.

[0322] The dimethicones according to the invention include polydimethylsiloxanes, (polydimethylsiloxane) (methylvinylsiloxane) copolymers and poly(dimethylsiloxane)(diphenyl)(methylvinylsiloxane) copolymers, and mixtures thereof.

[0323] The high molecular weight fluorosilicones according to the invention preferably have a molecular weight of between 200 000 and 300 000 and preferentially between 240 000 and 260 000 g/mol.

[0324] According to one of the aspects of the invention, the second composition according to the invention comprises at least one apolar or sparingly polar compound, which may be chosen from oils, gums and/or waxes. The second composition preferably comprises more than 70%, preferably more than 80% by weight and preferentially 100% by weight of apolar or sparingly polar compounds. These apolar or sparingly polar compounds comprise colouring agents or gelling agents.

[0325] According to one embodiment, the second composition comprises a mixture of a polymer with a weight-

average molecular mass of greater than or equal to 200 000 g/mol and a silicone oil as described above.

[0326] According to one embodiment, the second composition is transparent.

[0327] The term "transparent composition" means a transparent to translucent composition, i.e. a composition which is such that it transmits at least 40% of light and preferably at least 50% of light with a wavelength of 750 nm.

[0328] The transmission is measured using a Cary 300 Scan UV-visible spectrophotometer from the company Varian, according to the following protocol:

[0329] The composition is poured above its melting point into a spectrophotometer cuvette of square cross section with a side length of 10 mm.

[0330] The sample of the composition is then cooled for 24 hours at 35°C, and then kept in a chamber thermostatically maintained at 20°C for 24 hours.

[0331] The light transmitted through the sample of the composition is then measured by spectrophotometer by scanning wavelengths ranging from 700 nm to 800 nm, the measurement being performed in transmission mode.

[0332] The percentage of light transmitted through the sample of the composition at a wavelength of 750 nm is then determined.

[0333] When the second composition is transparent, it advantageously contains less than 5%, preferably less than 2% and more preferably less than 1% of pigments.

[0334] The high molecular weight polymer/liquid silicone compound mixture preferably represents more than 70%, preferably more than 80% by weight, preferably more than 90% by weight and more preferably more than 95% by weight of the second composition.

[0335] The second composition may comprise other compounds, which are preferably apolar or sparingly polar. These apolar or sparingly polar compounds are preferably silicone compounds, colouring agents or gelling agents.

[0336] According to one embodiment, the second composition comprises only apolar or sparingly polar ingredients.

[0337] The second composition advantageously contains at least one wax, especially when it is in solid form.

[0338] The waxes may be present in a proportion of 0.5-30% by weight in the composition and better still from 5% to 20% and preferably between 5% and 15% of the composition.

[0339] Linear hydrocarbon-based waxes are preferred in the context of the present invention. Their melting point is advantageously greater than 35°C, for example greater than 55°C and preferably greater than 80°C.

[0340] The linear hydrocarbon-based waxes are advantageously chosen from substituted linear alkanes, unsubstituted linear alkanes, unsubstituted linear alkenes and substituted linear alkenes, an unsubstituted compound being composed exclusively of carbon and hydrogen. The substituents mentioned above do not contain carbon atoms.

[0341] The linear hydrocarbon-based waxes include ethylene polymers and copolymers with a molecular weight of between 400 and 800, for example Polywax 500 or Polywax 400 sold by New Phase Technologies.

[0342] The linear hydrocarbon-based waxes include linear paraffin waxes, for instance the paraffins S&P 206, S&P 173 and S&P 434 from Strahl & Pitsch.

[0343] The linear hydrocarbon-based waxes include long-chain linear alcohols, for instance products comprising a mixture of polyethylene and of alcohols containing 20 to 50 carbon atoms, especially Performacol 425 or Performacol 550 (mixture in 20/80 proportions) sold by New Phase Technologies.

[0344] The second composition advantageously contains a silicone wax, such as a dimethicone comprising alkyl groups at the end of a chain. These alkyl groups preferably contain more than 18 carbon atoms, preferably between 20 and 50 and preferentially between 30 and 45 carbon atoms.

[0345] The silicone wax for example corresponds to formula (VI) or (VII)

in which R is an alkyl, X is greater than or equal to zero and N and Y are greater than or equal to one.

[0346] R contains from 1 to 50 carbon atoms provided that the compound is solid at room temperature.

[0347] Examples of silicone waxes include:

- C₂₀₋₂₄ alkyl methicone, C₂₄₋₂₈ alkyl dimethicone, C₂₀₋₂₄ alkyl dimethicone and C₂₄₋₂₈ alkyl dimethicone sold by Archimica Fine Chemicals under the reference SilCare 41M40, SilCare 41M50, SilCare 41M70 and SilCare 41M80,
- the stearyl dimethicones of reference SilCare 41M65 sold by Archimica or of reference DC-2503 sold by Dow Corning,
- the stearoxytrimethylsilanes sold under the reference SilCare 1M71 or DC-580,
- the products Abil Wax 9810, 9800 or 2440 from Wacker-Chemie GmbH,
- the C₃₀₋₄₅ alkyl methicones sold by Dow Corning under the reference AMS-C30 Wax, and also the C₃₀₋₄₅ alkyl-dimethicones sold by General Electric under the reference SF 1642 or SF 1632.

[0348] The first and/or the second composition of the cosmetic product according to the invention may contain a colouring agent that may be chosen from water-soluble or liposoluble dyes, pigments and naces, and mixtures thereof.

[0349] The term "pigments" should be understood as meaning white or coloured, mineral or organic particles, which are insoluble in the liquid organic phase and which are intended to colour and/or opacify the first composition.

[0350] The term "naces" should be understood as meaning iridescent particles produced especially by certain molluscs in their shell, or else synthesized, which are insoluble in the medium of the first composition.

[0351] The term "dyes" should be understood as meaning generally organic compounds that are soluble in fatty substances, for instance oils, or soluble in an aqueous-alcoholic phase.

[0352] The liposoluble dyes are, for example, Sudan Red, D&C Red No. 17, D&C Green No. 6, β -carotene, soybean oil, Sudan Brown, D&C Yellow No. 11, D&C Violet No. 2, D&C Orange No. 5, quinoline yellow, annatto and bromo acids.

[0353] The water-soluble dyes are, for example, beetroot juice, methylene blue and caramel.

[0354] The pigments may be interference or non-interference, mineral and/or organic, white or coloured pigments. Among the mineral pigments that may be mentioned are titanium dioxide, optionally surface-treated, zirconium oxide or cerium oxide, and also zinc oxide, iron oxide (black, yellow, brown or red) or chromium oxide, manganese violet, ultramarine blue, chromium hydrate and ferric blue. Among the organic pigments that may be mentioned are carbon black, pigments of barium, strontium, calcium or aluminium organic lake type, including those submitted for certification by the Food and Drug Administration (FDA) (for example D&C or FD&C) and those exempt from FDA certification, for instance lakes based on cochineal carmine.

[0355] The naces or nacreous pigments may be chosen from white nacreous pigments such as mica coated with titanium or with bismuth oxychloride, coloured nacreous pigments such as titanium mica with iron oxides, titanium mica with, especially, ferric blue or chromium oxide, titanium mica with an organic pigment of the abovementioned type, and also nacreous pigments based on bismuth oxychloride. Pigments with goniochromatic properties and/or pigments with a metallic effect as described in the patent application filed under the number FR 0209246, the content of which is incorporated by reference into the present patent application, may thus be used.

[0356] In general, the colouring agents represent from 0.001% to 60%, better still from 0.01% to 50% and even better still from 0.1% to 40% of the total weight of each first and second composition.

[0357] The first and/or the second composition of the invention may also contain one or more cosmetic or dermatological active agents such as those conventionally used.

[0358] As cosmetic, dermatological, hygiene or pharmaceutical active agents that may be used in the composition of the invention, mention may be made of moisturizers, vitamins, essential fatty acids, sphingo-lipids and sunscreens.

These active agents are used in the usual amount for those skilled in the art and especially at concentrations of from 0 to 20% and in particular from 0.001% to 15% relative to the total weight of the first or second composition.

[0359] The composition may also comprise any other additive usually used in such compositions, such as water, antioxidants, fragrances, preserving agents and essential oils.

[0360] Needless to say, a person skilled in the art will take care to select this or these optional compounds, and/or the amount thereof, such that the advantageous properties of the composition are not, or are not substantially, adversely affected by the envisaged addition.

[0361] The compositions of the product may be in the form of a cast product, for example in the form of a stick or wand, or in the form of a dish that may be used by direct contact or with a sponge. In particular, they find an application as cast foundations, cast makeup rouges or eyeshadows, lipsticks, lipcare bases or lipcare balms, concealer products and nail varnishes. They may also be in the form of a soft paste or a gel, a more or less fluid cream, or a liquid packaged in a tube.

[0362] The compositions of the product according to the invention may especially constitute a cosmetic care composition for the face, the neck, the hands or the body (for example a care cream, an antison oil or a body gel), a makeup composition (for example a makeup gel, a cream or a stick) or a composition for artificially tanning or protecting the skin.

[0363] The compositions of the product according to the invention may be in the form of a care composition for the skin and/or the integuments or in the form of an antison composition or a body hygiene composition, especially in the form of a deodorant. They are then especially in uncoloured form. They may then be used as a care base for the skin, the integuments or the lips (lip balms, for protecting the lips against the cold and/or sunlight and/or the wind, or care creams for the skin, the nails or the hair).

[0364] For the purposes of the invention, the term "cosmetically acceptable" means a composition of pleasant appearance, odour and feel.

[0365] Each composition of the product according to the invention may be in any galenical form normally used for topical application and especially in the form of an oily or aqueous solution, an oily or aqueous gel, an oil-in-water or water-in-oil emulsion, a multiple emulsion, a dispersion of oil in water using vesicles, the vesicles being located at the oil/water interface, or a powder. Each composition may be fluid or solid.

[0366] According to one embodiment, the first or the second composition, or both, have a continuous fatty phase preferably in anhydrous form and may contain less than 5% water and better still less than 1% water relative to the total weight of the first or second composition.

[0367] Each first and second composition may have the appearance of a lotion, a cream, an ointment, a soft paste, a salve, a solid that has been cast or moulded, especially as a stick or a dish, or a compacted solid.

[0368] Each composition may be packaged separately in the same packaging article, for example in a two-compartment pen, the base composition being delivered from one end of the pen and the top composition being delivered from the other end of the pen, each end being especially closed in a leaktight manner with a lid.

[0369] Alternatively, each of the compositions may be packaged in a different packaging article.

[0370] Preferably, the composition that is applied as the first coat is in liquid or pasty form, which is highly desirable in the case of a lipstick or an eyeliner.

[0371] The product according to the invention may be advantageously used for making up the skin and/or the lips and/or the integuments depending on the nature of the ingredients used. In particular, the product of the invention may be in the form of a solid foundation, a lipstick wand or paste, a concealer product, an eye contour product, an eyeliner, a mascara, an eyeshadow, a body-makeup product or a skin-colouring product.

[0372] Advantageously, the second composition has care, gloss or transparency properties.

[0373] A subject of the invention is also a lip product, a varnish, a mascara, a foundation, a tattoo, a makeup rouge or an eyeshadow comprising a first and a second composition as described above.

[0374] The compositions of the product of the invention may be obtained by heating the various constituents to the melting point of the highest-melting waxes, followed by casting the molten mixture in a mould (dish or finger stall). They may also be obtained by extrusion, as described in patent application EP-A-0 667 146.

[0375] The invention is illustrated in greater detail in the following examples. The percentages are percentages by weight.

Examples 9 to 13: First composition

Copolymer vinylpyrrolidone/ 1-eicosene (Antaron V-220, ISP)	1.2	1.2	1.2	1.2	1.2
Pigments	3	3	3	3	3

Procedure

[0377]

1. A ground pigmentary mixture of the pigments in the oily phase is prepared by treating the mixture three times in a three-roll mill.
2. The ground material required for the composition and the other ingredients are weighed out in a beaker.
3. The mixture is stirred using a Rayneri blender for 45 minutes.
4. The formula is cast in isododecane-leaktight cooling boxes.

Gloss measurement

[0378]

1. Films with a wet thickness of 50 and/or 150 μm are prepared using a mechanical applicator. The depositions are made on a contrast card.
2. The films are left to dry for 24 hours at a regulated temperature of 30°C.
3. The gloss measurements are performed using a Byk Gardner micro-tri-gloss glossmeter with measuring angles of 20° and 60°.

[0379] The gloss results obtained are given in the table below:

Wet 150 μm deposit

Angle	Deposit	Example	Mean (%)	Standard deviation
Angle of 20°	150 μm deposit	Example 9	54.2	2.0
		Example 10	41.0	3.5
Angle 60°	150 μm deposit	Example 9	75.7	0.8

EP 1 518 534 A2

		Example 10	73.6	1.6
--	--	------------	------	-----

Wet 50 μm deposit (closer when dry to the thickness applied to the lips)

Angle	Deposit	Example	Mean (%)	Standard deviation
Angle of 20°	50 μm deposit	Example 9	47.6	1.2
		Example 10	42.6	5.2
Angle of 60°	50 μm deposit	Example 9	69.3	0.7
		Example 10	74.8	1.0

Example 14: Second liquid composition

[0380]

Polydimethylsiloxane sold under the reference Silbione 70047 V by Rhodia (500 000 cSt - 250 000 g/mol)	40%
Polydimethylsiloxane sold by the company Dow Corning under the reference DC200 (5 cSt)	60%

[0381] The two ingredients are mixed together at 70°C using a Rayneri blender.

Example 15: Second solid composition

[0382]

	% by weight
Silicone oil (PDMS)	25
DC200 from Dow Corning (5 cSt)	
Dimethicone (and) Dimethiconol	61
D2-9085 from Dow Corning (1550 cSt)	
Trifluoropropyl dimethicone (100 cSt)	1
X22-819 from Shin-Etsu	
C30-45 Alkyl dimethicone	5
(SF 1642 from GE Bayer Silicone)	
Polyethylene wax (weight-average MW 500)	8

[0383] The silicone oil, the dimethiconol and the fluoro dimethicone are mixed together while hot until a uniform mixture is formed. The C₃₀-C₄₅ alkyl dimethicone is then added to the above mixture brought to 110°C. The polyethylene

EP 1 518 534 A2

wax is then added portionwise until a uniform mixture is obtained. The mixture is cooled to 90-95°C and then poured into the moulds, which are placed at -20°C for 30 minutes. Finally, the sticks are stripped from the moulds.

Example 16: Measurement of the transfer resistance of the product comprising the composition of Example 11 as first composition and the composition of Example 15 as second composition

[0384] The transfer index of the product comprising the composition of Example 11 as first composition and the composition of Example 15 as second composition is measured according to the method described above.

[0385] The transfer index of the product Lipfinity (shade .70), comprising a liquid lipstick and a colourless balm, is measured by proceeding as previously.

Product whose transfer resistance is evaluated	Transfer value (in %)
Composition of Example 11 onto which is applied the composition of Example 15	4 ± 0.5
Lipfinity product from Max Factor	5 ± 0

First composition

[0386]

Polymer of Example 1	23.8 g AM
Butyl acetate	24.99 g
Isopropanol	10.71 g
Hexylene glycol	2.5 g
DC Red 7 Lake	1 g
Hectorite modified with distearyl- dimethylbenzylammonium chloride (Bentone® 27V from Elementis)	1.3 g
Ethyl acetate	qs 100 g

Second composition

[0387]

Nitrocellulose	15 g
N-ethyl-o,p-toluenesulfonamide	4 g
Tributyl acetyl citrate	2 g
IPA	6.5 g
qs (ethyl acetate, butyl acetate)	100 g

[0388] The first composition is applied to an individual's nails or false nails. Next, after drying, the second composition is applied over this first composition. The product obtained has noteworthy staying power, in particular noteworthy gloss fastness.

Example 18: Nail varnish kit

First composition

[0389]

Polymer of Example 8	23.8 g AM
DC Red 7 Lake	1 g
Hectorite modified with distearyl- dimethylbenzylammonium chloride (Bentone® 27V from Elementis)	1.3 g

EP 1 518 534 A2

[0402] A film of mascara composition of the second composition 300 micrometers thick is spread onto a glass plate. It is left to dry for 2 hours at room temperature (25°C).

A film of the first composition 300 micrometers thick is then spread on top.

The assembly is left to dry for 24 hours at room temperature (25°C).

[0403] The mean gloss at 60° of the final film is then measured according to the method described above. The mean gloss of the product is 60.4.

Claims

1. Cosmetic product comprising a first and a second composition, the first composition containing, in a cosmetically acceptable organic liquid medium, at least one film-forming linear ethylenic block polymer, and the second composition, which is different from the first, comprising a cosmetically acceptable medium.
2. Cosmetic product according to Claim 1, **characterized in that** the block polymer is free of styrene units.
3. Cosmetic product according to Claim 1 or 2, **characterized in that** the block polymer is non-elastomeric.
4. Product according to one of the preceding claims, **characterized in that** the block polymer is an ethylenic polymer derived from aliphatic ethylenic monomers comprising a carbon-carbon double bond and at least one ester group -COO- or amide group -CON-.
5. Product according to one of the preceding claims, **characterized in that** the block polymer is not soluble at an active material content of at least 1% by weight in water or in a mixture of water and of linear or branched lower monoalcohols containing from 2 to 5 carbon atoms, without modification of pH, at room temperature (25°C).
6. Product according to one of the preceding claims, **characterized in that** the block polymer contains first and second blocks linked together via an intermediate segment comprising at least one constituent monomer of the first block and at least one constituent monomer of the second block.
7. Product according to one of the preceding claims, **characterized in that** the block polymer contains first and second blocks that have different glass transition temperatures (Tg).
8. Product according to the preceding claim, **characterized in that** the first and second blocks are linked together via an intermediate segment with a glass transition temperature between the glass transition temperatures of the first and second blocks.
9. Product according to any one of the preceding claims, **characterized in that** the block polymer contains first and second blocks that are incompatible in the said organic liquid medium.
10. Product according to one of the preceding claims, **characterized in that** the block polymer has a polydispersity index I of greater than 2.
11. Product according to Claim 7, **characterized in that** the first block of the polymer is chosen from:
 - a) a block with a Tg of greater than or equal to 40°C,
 - b) a block with a Tg of less than or equal to 20°C,
 - c) a block with a Tg of between 20 and 40°C, and

the second block is chosen from a category a), b) or c) different from the first block.
12. Product according to Claim 11, **characterized in that** the block with a Tg of greater than or equal to 40°C is totally or partially derived from one or more monomers, which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C.
13. Product according to the preceding claim, **characterized in that** the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from the following monomers:
 - methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3) - \text{COOR}_1$

in which R₁ represents a linear or branched unsubstituted alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group or R₁ represents a C₄ to C₁₂ cycloalkyl group,
 - acrylates of formula $\text{CH}_2 = \text{CH} - \text{COOR}_2$

in which R₂ represents a C₄ to C₁₂ cycloalkyl group such as isobornyl acrylate or a tert-butyl group,

- (meth)acrylamides of formula:

in which R_7 and R_8 , which may be identical or different, each represent a hydrogen atom or a linear or branched C_1 to C_{12} alkyl group such as an n-butyl, t-butyl, isopropyl, isohexyl, isooctyl or isononyl group; or R_7 represents H and R_8 represents a 1,1-dimethyl-3-oxobutyl group, and R' denotes H or methyl,

- and mixtures thereof.

14. Product according to Claim 12 or 13, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from methyl methacrylate, isobutyl (meth)acrylate and isobornyl (meth)acrylate, and mixtures thereof.

15. Product according to Claim 11, characterized in that the block with a T_g of less than or equal to 20°C is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C .

16. Product according to Claim 15, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of less than or equal to 20°C are chosen from the following monomers:

- acrylates of formula $\text{CH}_2 = \text{CHCOOR}_3$,

R_3 representing a linear or branched C_1 to C_{12} unsubstituted alkyl group, with the exception of the tert-butyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,

- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{-COOR}_4$,

R_4 representing a linear or branched C_6 to C_{12} unsubstituted alkyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,

- vinyl esters of formula $\text{R}_5\text{-CO-O-CH} = \text{CH}_2$

in which R_5 represents a linear or branched C_4 to C_{12} alkyl group,

- C_4 to C_{12} alkyl vinyl ethers,
- N-(C_4 to C_{12}) alkyl acrylamides, such as N-octylacrylamide,
- and mixtures thereof.

17. Product according to Claim 15 or 16, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of less than or equal to 20°C are chosen from alkyl acrylates whose alkyl chain contains from 1 to 10 carbon atoms, with the exception of the tert-butyl group.

18. Product according to Claim 11, characterized in that the block with a T_g of between 20 and 40°C is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of between 20 and 40°C .

19. Product according to Claim 11, characterized in that the block with a T_g of between 20 and 40°C is totally or partially derived from monomers which are such that the corresponding homopolymer has a T_g of greater than or equal to 40°C and from monomers which are such that the corresponding homopolymer has a T_g of less than or equal to 20°C .

20. Product according to Claim 18 or 19, characterized in that the block with a T_g of between 20 and 40°C is totally or partially derived from monomers chosen from methyl methacrylate, isobornyl acrylate and methacrylate, butyl acrylate and 2-ethylhexyl acrylate, and mixtures thereof.

21. Product according to one of Claims 11 to 20, characterized in that it comprises a block polymer comprising at least one first block and at least one second block, the first block having a glass transition temperature (T_g) of greater than or equal to 40°C and the second block having a glass transition temperature of less than or equal to 20°C.

22. Product according to the preceding claim, characterized in that the first block is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C.

23. Product according to claim 22, characterized in that the first block is a copolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C.

24. Product according to Claim 22 or 23, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from the following monomers:

- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3) - \text{COOR}_1$
in which R₁ represents a linear or branched unsubstituted alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group or R₁ represents a C₄ to C₁₂ cycloalkyl group,
- acrylates of formula $\text{CH}_2 = \text{CH} - \text{COOR}_2$
in which R₂ represents a C₄ to C₁₂ cycloalkyl group such as isobornyl acrylate or a tert-butyl group,
- (meth)acrylamides of formula:

in which R₇ and R₈, which may be identical or different, each represent a hydrogen atom or a linear or branched C₁ to C₁₂ alkyl group such as an n-butyl, t-butyl, isopropyl, isohexyl, isooctyl or isononyl group; or R₇ represents H and R₈ represents a 1,1-dimethyl-3-oxobutyl group, and R' denotes H or methyl

- and mixtures thereof.

25. Product according to one of Claims 22 to 24, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from methyl methacrylate, isobutyl (meth)acrylate and isobornyl (meth)acrylate, and mixtures thereof.

26. Product according to one of Claims 22 to 25, characterized in that the proportion of the first block ranges from 20% to 90% by weight, better still from 30% to 80% and even better still from 50% to 70% by weight of the polymer.

27. Product according to one of Claims 21 to 26, characterized in that the second block is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C.

28. Product according to one of Claims 21 to 27, characterized in that the second block is a homopolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C.

29. Product according to Claim 27 or 28, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of less than or equal to 20°C are chosen from the following monomers:

- acrylates of formula $\text{CH}_2 = \text{CHCOOR}_3$,
R₃ representing a linear or branched C₁ to C₁₂ unsubstituted alkyl group, with the exception of the tert-butyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,
- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3) - \text{COOR}_4$,

R_4 representing a linear or branched C_6 to C_{12} unsubstituted alkyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,

- vinyl esters of formula $R_5-CO-O-CH=CH_2$
in which R_5 represents a linear or branched C_4 to C_{12} alkyl group,
- C_4 to C_{12} alkyl vinyl ethers,
- N- (C_4 to C_{12}) alkyl acrylamides, such as N-octylacrylamide,
- and mixtures thereof.

30. Product according to one of Claims 27 to 29, **characterized in that** the monomers whose corresponding homopolymer has a glass transition temperature of less than or equal to 20°C are chosen from alkyl acrylates whose alkyl chain contains from 1 to 10 carbon atoms, with the exception of the tert-butyl group.

31. Product according to one of Claims 21 to 30, **characterized in that** the proportion of the second block with a T_g of less than or equal to 20°C ranges from 5% to 75% by weight, better still from 15% to 50% and even better still from 25% to 45% by weight of the polymer.

32. Product according to one of Claims 11 to 20, **characterized in that** it comprises a block polymer comprising at least one first block and at least one second block, the first block having a glass transition temperature (T_g) of between 20 and 40°C and the second block having a glass transition temperature of less than or equal to 20°C or a glass transition temperature of greater than or equal to 40°C .

33. Product according to the preceding claim, **characterized in that** the first block with a T_g of between 20 and 40°C is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of between 20 and 40°C .

34. Product according to Claim 32 or 33, **characterized in that** the first block with a T_g of between 20 and 40°C is a copolymer derived from monomers which are such that the corresponding homopolymer has a T_g of greater than or equal to 40°C and from monomers which are such that the corresponding homopolymer has a T_g of less than or equal to 20°C .

35. Product according to one of Claims 32 to 34, **characterized in that** the first block with a T_g of between 20 and 40°C is derived from monomers chosen from methyl methacrylate, isobornyl acrylate and methacrylate, butyl acrylate and 2-ethylhexyl acrylate, and mixtures thereof.

36. Product according to one of Claims 32 to 35, **characterized in that** the proportion of the first block with a T_g of between 20 and 40°C ranges from 10% to 85%, better still from 30% to 80% and even better still from 50% to 70% by weight of the polymer.

37. Product according to any one of Claims 32 to 35, **characterized in that** the second block has a T_g of greater than or equal to 40°C and is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C .

38. Product according to any one of Claims 32 to 37, **characterized in that** the second block has a T_g of greater than or equal to 40°C and is a homopolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of greater than or equal to 40°C .

39. Product according to either of Claims 37 and 38, **characterized in that** the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from the following monomers:

- methacrylates of formula $CH_2=C(CH_3)-COOR_1$
in which R_1 represents a linear or branched unsubstituted alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group or R_1 represents a C_4 to C_{12} cycloalkyl group,
- acrylates of formula $CH_2=CH-COOR_2$
in which R_2 represents a C_4 to C_{12} cycloalkyl group such as isobornyl acrylate or a tert-butyl group,
- (meth)acrylamides of formula:

in which R_7 and R_8 , which may be identical or different, each represent a hydrogen atom or a linear or branched C_1 to C_{12} alkyl group such as an n-butyl, t-butyl, isopropyl, isohexyl, isooctyl or isononyl group; or R_7 represents H and R_8 represents a 1,1-dimethyl-3-oxobutyl group, and R' denotes H or methyl and mixtures thereof.

40. Product according to one of Claims 36 to 39, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of greater than or equal to 40°C are chosen from methyl methacrylate, isobutyl methacrylate and isobornyl (meth)acrylate, and mixtures thereof.

41. Product according to one of Claims 37 to 40, characterized in that the proportion of the second block with a T_g of greater than or equal to 40°C ranges from 10% to 85%, preferably from 20% to 70% and better still from 30% to 70% by weight of the polymer.

42. Product according to one of Claims 32 to 41, characterized in that the second block has a T_g of less than or equal to 20°C and is totally or partially derived from one or more monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C .

43. Product according to one of Claims 32 to 41, characterized in that the second block has a T_g of less than or equal to 20°C and is a homopolymer derived from monomers which are such that the homopolymer prepared from these monomers has a glass transition temperature of less than or equal to 20°C .

44. Product according to Claim 42 or 43, characterized in that the monomers whose corresponding homopolymer has a glass transition temperature of less than or equal to 20°C are chosen from the following monomers:

- acrylates of formula $\text{CH}_2 = \text{CHCOOR}_3$,
 R_3 representing a linear or branched C_1 to C_{12} unsubstituted alkyl group, with the exception of the tert-butyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,
- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{COOR}_4$,
 R_4 representing a linear or branched C_6 to C_{12} unsubstituted alkyl group, in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated,
- vinyl esters of formula $\text{R}_5\text{-CO-O-CH} = \text{CH}_2$
in which R_5 represents a linear or branched C_4 to C_{12} alkyl group,
- C_4 to C_{12} alkyl vinyl ethers,
- N-(C_4 to C_{12})alkyl acrylamides, such as N-octylacrylamide,
- and mixtures thereof.

45. Product according to one of Claims 42 to 44, characterized in that the monomers whose homopolymers have glass transition temperatures of less than or equal to 20°C are chosen from alkyl acrylates whose alkyl chain contains from 1 to 10 carbon atoms, with the exception of the tert-butyl group.

46. Product according to one of Claims 42 to 45, characterized in that the proportion of the block with a glass transition temperature of greater than or equal to 40°C ranges from 20% to 90%, better still from 30% to 80% and even better still from 50% to 70% by weight of the polymer.

47. Product according to one of Claims 5 to 8 or any one of the preceding claims dependent thereon, characterized in that the first block and/or the second block comprises at least one additional monomer.

48. Product according to the preceding claim, characterized in that the additional monomer is chosen from hydrophilic monomers and ethylenically unsaturated monomers comprising one or more silicon atoms, and mixtures thereof.

49. Product according to Claim 47 or 48, characterized in that the additional monomer is chosen from:

a) hydrophilic monomers such as:

- ethylenically unsaturated monomers comprising at least one carboxylic or sulfonic acid function, for instance:

acrylic acid, methacrylic acid, crotonic acid, maleic anhydride, itaconic acid, fumaric acid, maleic acid, acrylamidopropanesulfonic acid, vinylbenzoic acid, vinylphosphoric acid, and salts thereof,

- ethylenically unsaturated monomers comprising at least one tertiary amine function, for instance 2-vinylpyridine, 4-vinylpyridine, dimethylaminoethyl methacrylate, diethylaminoethyl methacrylate and dimethylaminopropylmethacrylamide, and salts thereof,

- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{-COOR}_6$

in which R_6 represents a linear or branched alkyl group containing from 1 to 4 carbon atoms, such as a methyl, ethyl, propyl or isobutyl group, the said alkyl group being substituted with one or more substituents chosen from hydroxyl groups (for instance 2-hydroxypropyl methacrylate and 2-hydroxyethyl methacrylate) and halogen atoms (Cl, Br, I or F), such as trifluoroethyl methacrylate,

- methacrylates of formula $\text{CH}_2 = \text{C}(\text{CH}_3)\text{-COOR}_9$,

R_9 representing a linear or branched C_6 to C_{12} alkyl group in which one or more hetero atoms chosen from O, N and S is (are) optionally intercalated, the said alkyl group being substituted with one or more substituents chosen from hydroxyl groups and halogen atoms (Cl, Br, I or F);

- acrylates of formula $\text{CH}_2 = \text{CHCOOR}_{10}$,

R_{10} representing a linear or branched C_1 to C_{12} alkyl group substituted with one or more substituents chosen from hydroxyl groups and halogen atoms (Cl, Br, I or F), such as 2-hydroxypropyl acrylate and 2-hydroxyethyl acrylate, or R_{10} represents a C_1 to C_{12} alkyl-O-POE (polyoxyethylene) with repetition of the oxyethylene unit 5 to 30 times, for example methoxy-POE, or

R_{10} represents a polyoxyethylenated group comprising from 5 to 30 ethylene oxide units, and

b) ethylenically unsaturated monomers comprising one or more silicon atoms, such as methacryloxypropyltrimethoxysilane and methacryloxypropyl-tris(trimethylsiloxy)silane,

- and mixtures thereof.

50. Product according to either of Claims 47 and 48, characterized in that each of the first and second blocks comprises at least one additional monomer chosen from acrylic acid, (meth)acrylic acid and trifluoroethyl methacrylate, and mixtures thereof.

51. Product according to either of Claims 47 and 48, characterized in that each of the first and second blocks comprises at least one monomer chosen from (meth)acrylic acid esters and optionally at least one additional monomer such as (meth)acrylic acid, and mixtures thereof.

52. Product according to either of Claims 47 and 48, characterized in that each of the first and second blocks is totally derived from at least one monomer chosen from (meth)acrylic acid esters and optionally from at least one additional monomer such as (meth)acrylic acid, and mixtures thereof.

53. Product according to one of Claims 47 to 52, characterized in that the additional monomer(s) represent(s) from 1% to 30% by weight relative to the total weight of the first and/or second blocks.

54. Product according to Claim 7 or any one of the preceding claims dependent thereon, characterized in that the difference between the glass transition temperatures (T_g) of the first and second blocks is greater than 10°C , better still greater than 20°C , preferably greater than 30°C and better still greater than 40°C .

55. Product according to Claim 10, characterized in that the block polymer has a polydispersity index of greater than or equal to 2.5 and preferably greater than or equal to 2.8.

56. Product according to Claim 55, characterized in that it has a polydispersity index of between 2.8 and 6.

57. Product according to one of the preceding claims, characterized in that the block polymer has a weight-average molecular mass (M_w) of less than or equal to 300 000.

EP 1 518 534 A2

58. Product according to Claim 57, **characterized in that** the weight-average mass (M_w) ranges from 35 000 to 200 000 and better still from 45 000 to 150 000.
59. Product according to Claim 58, **characterized in that** the weight-average mass (M_n) is less than or equal to 70 000.
60. Product according to one of Claims 57 to 59, the weight-average mass (M_n) of which ranges from 10 000 to 60 000 and better still from 12 000 to 50 000.
61. Product according to one of the preceding claims, **characterized in that** it comprises from 0.1% to 60% by weight, preferably from 5% to 50% by weight and more preferably from 10% to 40% by weight of polymer active material.
62. Product according to one of the preceding claims, **characterized in that** the second composition is transparent.
63. Product according to one of the preceding claims, **characterized in that** the second composition contains less than 5%, preferably less than 2% and more preferably less than 1% of pigments.
64. Product according to one of the preceding claims, **characterized in that** the first composition has a transfer index of less than 40, preferably less than or equal to 30, preferably less than or equal to 20, preferably less than or equal to 15, preferably less than or equal to 10, preferably less than or equal to 5 and more preferably less than or equal to 2 out of 100.
65. Product according to one of the preceding claims, **characterized in that** the second composition is chosen such that the transfer index of the said product is less than or equal to 40, preferably less than or equal to 30, preferably less than or equal to 20, preferably less than or equal to 15, preferably less than or equal to 10 and preferentially less than or equal to 5.
66. Product according to one of the preceding claims, **characterized in that** the mean gloss measured at 20° of the first composition, once spread onto a support, is greater than or equal to 30, preferably greater than or equal to 40, preferably greater than or equal to 50 and preferentially greater than or equal to 60.
67. Product according to one of the preceding claims, **characterized in that** the second composition is chosen such that the mean gloss of the product measured at 20°, the product being spread onto a support, is greater than or equal to 30, preferably greater than or equal to 40, preferably greater than or equal to 50 and preferentially greater than or equal to 60.
68. Product according to one of the preceding claims, **characterized in that** the second composition is chosen such that the product, applied to a keratin material, has at least one cosmetic property that is improved relative to the first composition, when the first composition is applied alone to the said keratin material.
69. Product according to Claim 68, **characterized in that** the second composition is chosen such that the product, applied to a keratin material, is less tacky than the first composition, applied alone to the said keratin material.
70. Product according to Claim 68 or 69, **characterized in that** the second composition is chosen such that the product, applied to a keratin material, is more comfortable than the first composition, applied alone to the said keratin material.
71. Product according to one of the preceding claims, **characterized in that** the cosmetically acceptable medium of the second composition contains a non-volatile liquid phase comprising a hydrocarbon-based oil, a fluoro oil and/or a silicone oil.
72. Product according to one of the preceding claims, **characterized in that** the cosmetically acceptable medium of the second composition comprises a silicone polymer with a weight-average molecular mass of between 200 000 and 4 000 000 and more preferably between 200 000 and 2 000 000 g/mol, chosen from dimethiconols and polydimethylsiloxanes, and mixtures thereof.
73. Product according to one of the preceding claims, **characterized in that** the first composition and/or the second composition contains a colouring agent chosen from liposoluble dyes, water-soluble dyes, pigments and naces, and mixtures thereof.

EP 1 518 534 A2

74. Product according to one of the preceding claims, characterized in that the first and/or the second composition is in the form of an anhydrous liquid, an anhydrous stick or an emulsion.

5 75. Product according to one of the preceding claims, characterized in that it is in the form of a foundation, a makeup rouge, an eyeshadow, a lipstick, a product with care properties, a mascara, an eyeliner, a nail varnish, a concealer product or a body makeup product.

10 76. Process for making up the skin and/or the lips and/or the integuments, which consists in applying to the skin, the lips and/or the integuments a first coat of a first composition comprising, in a first cosmetically acceptable medium, at least one film-forming linear ethylenic block polymer and a colouring agent, and then in applying, over all or part of the said first coat, a second coat of a second composition comprising a second cosmetically acceptable medium.

15 77. Process for making up the skin and/or the lips and/or the integuments, which consists in applying to the skin, the lips and/or the integuments a first coat of a first composition comprising, in a first cosmetically acceptable medium, at least one film-forming linear ethylenic block polymer and a colouring agent, in leaving the said first coat to dry and then in applying, over all or part of the first coat, a second coat of a second composition comprising a second cosmetically acceptable medium.

20 78. Process for making up the skin and/or the lips and/or the integuments, which consists in applying to the skin and/or the lips and/or the integuments a cosmetic product according to one of Claims 1 to 75.

79. Makeup kit comprising a product according to one of Claims 1 to 75.

25 80. Use of a cosmetic product comprising a first and a second composition, the first composition comprising, in a first cosmetically acceptable medium, at least one film-forming linear ethylenic block polymer, and the second composition comprising a second cosmetically acceptable medium, at least one of the said compositions containing a colouring agent, to give the skin and/or the lips and/or the integuments a comfortable, glossy, transfer-resistant and/or migration-resistant makeup and/or a makeup with good colour fastness and/or with good gloss fastness.
